MULTIREFERENCE EFFECTIVE HAMILTONIAN THEORIES

Difficulties with this strategy:

1. Intruder state problem $E_P - E_Q \rightarrow 0$
2. Redundancy problem (balance the number of parameters and conditions)

EXAMPLE: THE INTRUDER STATE PROBLEM IN QDPT2

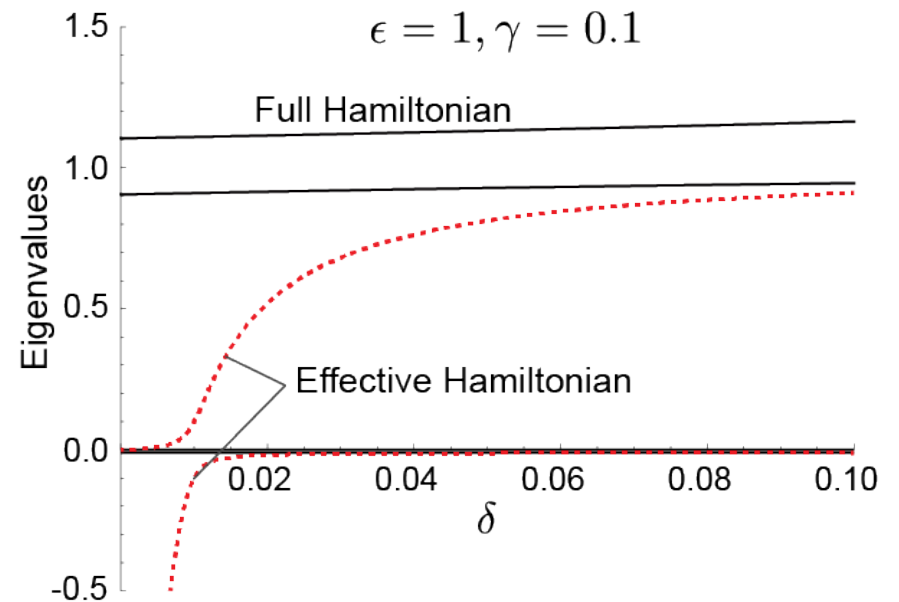

Quasi-degenerate perturbation theory (Brandow, Lindgren, Freed, ...)

$$H_{PP'}^{\text{eff},(2)} = \langle \Phi_P | \hat{H} | \Phi_{P'} \rangle + \frac{1}{2} \sum_q \frac{\langle \Phi_P | \hat{V} | \Phi_Q \rangle \langle \Phi_Q | \hat{V} | \Phi_{P'} \rangle}{E_P^{(0)} - E_Q^{(0)}} + \text{H.c.}$$

A model for intruder states in QDPT2

$$\mathbf{H} = \left(\begin{array}{cc|cc} 0 & \gamma & 0 & 0 \\ \gamma & \epsilon & \gamma & \gamma \\ \hline 0 & \gamma & \epsilon + \delta & 0 \end{array} \right) \quad \begin{array}{l} \delta \\ \epsilon \end{array}$$

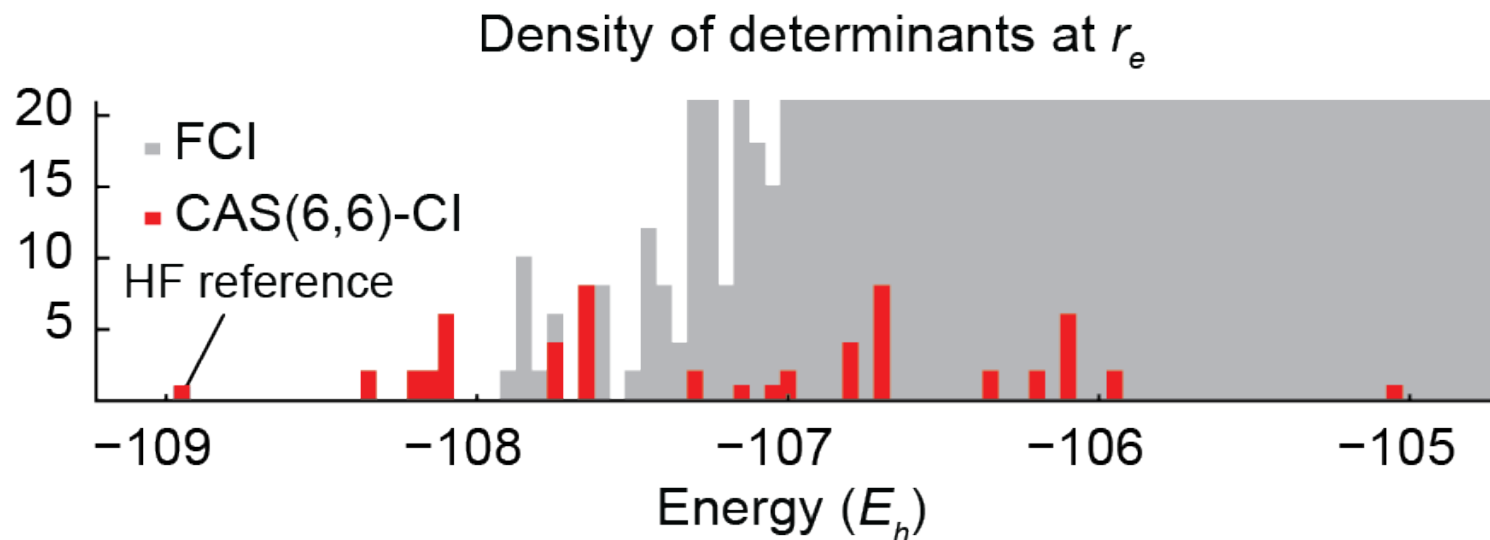

$$\mathbf{H}^{\text{eff},(2)} = \left(\begin{array}{cc} 0 & \gamma \\ \gamma & \epsilon - \frac{\gamma^2}{\delta} \end{array} \right)$$

EXAMPLE: THE INTRUDER STATE PROBLEM IN QDPT2

Quasi-degenerate perturbation theory (Brandow, Lindgren, Freed, ...)

$$H_{PP'}^{\text{eff},(2)} = \langle \Phi_P | \hat{H} | \Phi_{P'} \rangle + \frac{1}{2} \sum_q \frac{\langle \Phi_P | \hat{V} | \Phi_Q \rangle \langle \Phi_Q | \hat{V} | \Phi_{P'} \rangle}{E_P^{(0)} - E_Q^{(0)}} + \text{H.c.}$$

AN ADAPTIVE STRATEGY TO MULTIREFERENCE PROBLEMS

We are developing:

- (1) Renormalization Group (RG) approaches for dynamical electron correlation.
- (2) Adaptive diagonalization methods to address strong electron correlation (ground and excited states).

THE SIMILARITY RENORMALIZATION GROUP (OR FLOW RG)

Stanisław Glazek, Kenneth Wilson, Franz Wegner

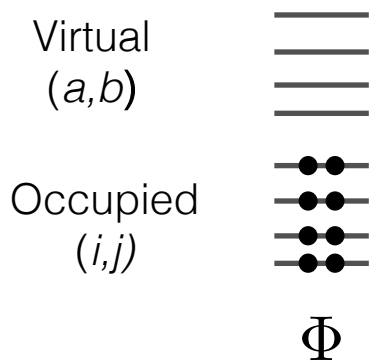

The basic idea behind the SRG approach:

Glazek, S. D.; Wilson, K. G. *Phys. Rev. D* (1994). Wegner, F. *Ann. Phys.* (1994), White, S. R. *J. Chem. Phys.* (2002).

THE SIMILARITY RENORMALIZATION GROUP FORMALISM

The bare Hamiltonian

Virtual
(a, b)

Occupied
(i, j)

Φ

$$H = E_0 + \sum_p \epsilon_p \{ \hat{a}_q^p \} + \frac{1}{4} \sum_{pqrs} \langle pq || rs \rangle \{ \hat{a}_{rs}^{pq} \}$$

Normal ordered¹ with respect to Φ

Unitary flow of the Hamiltonian

$$H(s) = U(s) H U^\dagger(s) \leftarrow s \text{ is a time-like parameter} \quad U(0) = 1$$

The flow equation for the Hamiltonian

$$\frac{dH(s)}{ds} = [\eta(s), H(s)] \quad \eta(s) = \frac{dU(s)}{ds} U(s)^\dagger = -\eta^\dagger(s)$$

The derivative of the Hamiltonian depends on the *flow generator* $\eta(s)$

1) Tsukiyama, K.; Bogner, S. K.; Schwenk, A. *Phys. Rev. C* (2012)

THE SRG FORMALISM

The SRG recipe: define a generator and *integrate* the RG flow equation

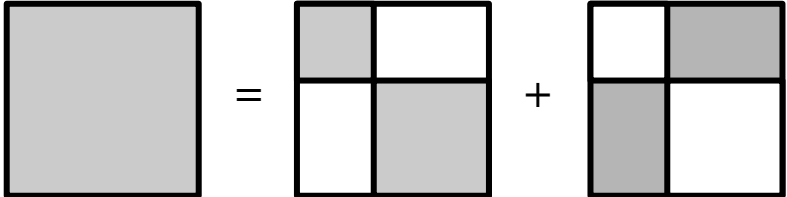

The transformed Hamiltonian

$$\begin{aligned}
 H(s) &= E_0(s) + F(s) + V(s) + W(s) + \dots \\
 &= E_0(s) + \sum_{pq} f_p^q(s) \{\hat{a}_q^p\} + \frac{1}{4} \sum_{pqrs} v_{pq}^{rs}(s) \{\hat{a}_{rs}^{pq}\} + \dots
 \end{aligned}$$

The SRG(2) keeps only these terms

CHOOSING THE GENERATOR $\eta(s)$

A certain class of flow generators brings the Hamiltonian to a band-diagonal form

$$H(s) = H^d(s) + H^{od}(s)$$

$$\eta(s) = [H^d(s), H(s)] \Rightarrow \frac{d\|H^{od}(s)\|_F^2}{ds} = -\|\eta(s)\|_F^2 \leq 0$$

Example: the *canonical generator of Wegner*

$$H^{od}(s) = \sum_{ia} f_a^i(s) \{\hat{a}_i^a\} + \frac{1}{4} \sum_{ijab} v_{ab}^{ij}(s) \{\hat{a}_{ij}^{ab}\} + \text{H.c.}$$

decouples a Slater determinant from the S + D space

$$\lim_{s \rightarrow \infty} v_{ab}^{ij}(s) = 0 \Rightarrow \lim_{s \rightarrow \infty} \langle \Phi_{ij}^{ab} | H(s) | \Phi \rangle = 0$$

PERTURBATIVE ANALYSIS

How does the SRG avoid problems with small denominators?

$$v_{ij}^{ab,(1)}(s) = \langle ij || ab \rangle e^{-s(\epsilon_i + \epsilon_j - \epsilon_a - \epsilon_b)^2}$$

Møller-Plessett denominator corresponding to Φ_{ij}^{ab} ←

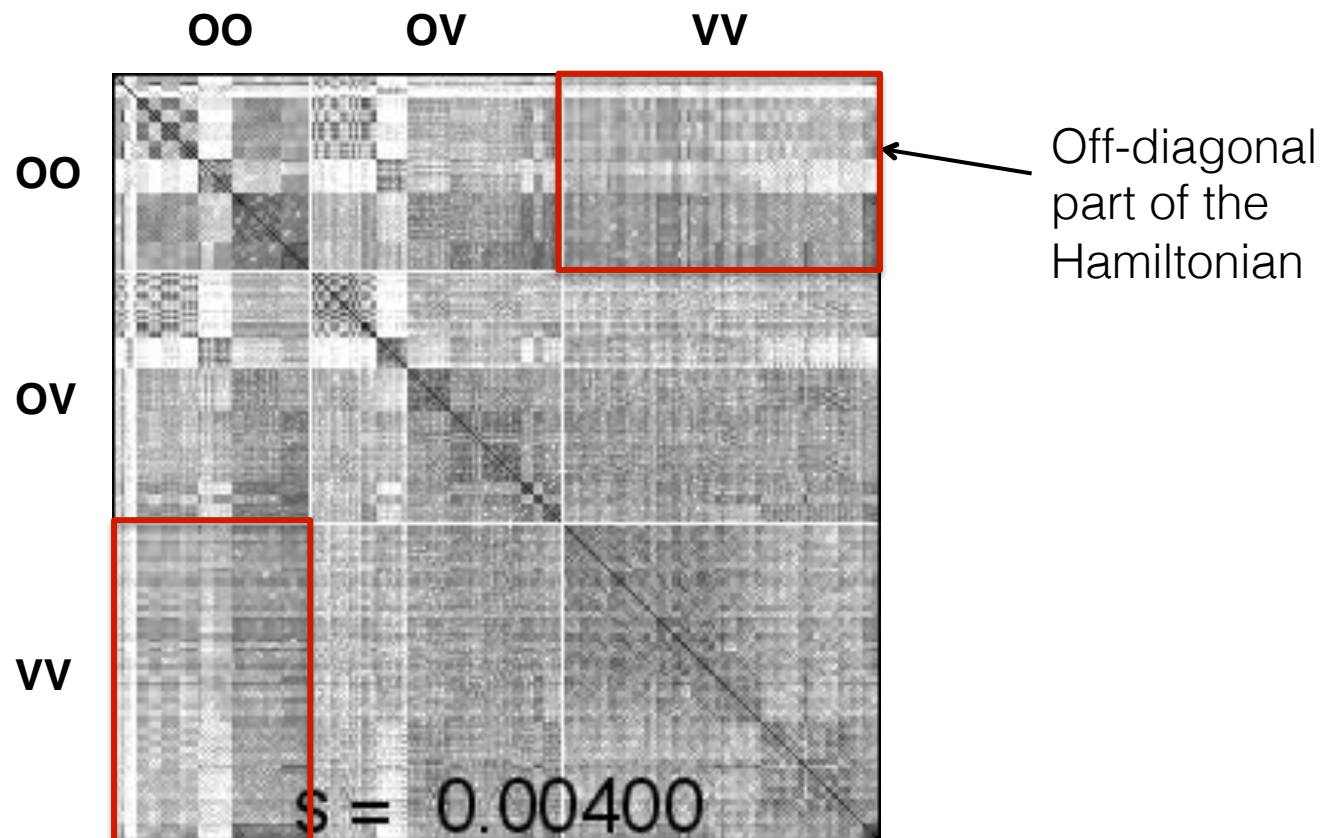

$$|\epsilon_i + \epsilon_j - \epsilon_a - \epsilon_b| \gg s^{-1/2} \Rightarrow v_{ij}^{ab,(1)}(s) \approx 0$$

EXAMPLE: FLOW OF THE HAMILTONIAN

$$V(s) = \frac{1}{4} \sum_{pqrs} v_{pq}^{rs}(s) \{ \hat{a}_p^\dagger \hat{a}_q^\dagger \hat{a}_s \hat{a}_r \}$$

Sorted
according to
the value of
 $\epsilon_p + \epsilon_q$

GOING BEYOND THE SRG: MOTIVATIONS

Eric Jurgenson's Ph.D. Thesis

One difference between these procedures is that $V_{\text{low } k}$ can be formulated as an integral transformation¹³ while the SRG is currently only differential; here $V_{\text{low } k}$ is implemented as a single transformation on the initial matrix, while the SRG flows to the desired amount of transformation. An integrated form of the SRG would be useful in understanding the exact correspondence between the two procedures, and to what extent $V_{\text{low } k}$ is a subset of these block-diagonal SRG forms.

Limitations of the SRG:

1. Requires solving a set of ODEs
2. Appears to work only with a unitary transformation

The proof of the trace condition relies on the unitarity of the transformation

$$\frac{d||H^{\text{od}}(s)||_F^2}{ds} \leq 0$$

GOING BEYOND THE SRG: THE DRIVEN SRG¹

The basic idea of the DSRG

Let the flow of $H(s)$ be defined by the (parameterized) evolution of its off-diagonal block. That is, given $R(s)$

$$\text{find } U(s) : [U(s)HU^\dagger(s)]^{\text{od}} = R(s)$$

1) Evangelista, F.A., *J. Chem. Phys.* (2014)

GOING BEYOND THE SRG: THE DRIVEN SRG

The DSRG ansatz and flow

$$\bar{H}(s) = e^{-S(s)} H e^{S(s)}$$

$$[\bar{H}(s)]_N = R(s)$$

Unitary or intermediate normalization (CC):

$$S(s) = \begin{cases} T(s) \\ A(s) = T(s) - T^\dagger(s) \end{cases}$$

The DSRG flow is driven by the *source operator* $R(s)$

N: *non-diagonal diagrams*

Boundary conditions on the source operator: $[\bar{H}(s)]_N = R(s)$

$$[\bar{H}(0)]_N = R(0) = H_N$$

$$[\bar{H}(\infty)]_N = 0 \quad \text{if } \Delta \neq 0$$

The DSRG source operator used in this work (reproduces SRG-MBPT2 results)

$$r_{ab}^{ij}(s) = \left[\bar{H}_{ab}^{ij}(s) + t_{ab}^{ij}(s) \Delta_{ab}^{ij} \right] e^{-s(\Delta_{ab}^{ij})^2}$$

THE SINGLE-REFERENCE UNITARY DSRG(2)

The *unitary* DSRG(2) truncation scheme is defined by the following

$$S(s) \approx T_1(s) - T_1^\dagger(s) + T_2(s) - T_2^\dagger(s)$$

And the BCH expansion is truncated to one- and two-particle contributions¹

$$\bar{H}_{1,2} = H + \sum_{k=1}^{\infty} \frac{1}{k!} \underbrace{[\cdots [[H, S]_{1,2}, S]_{1,2}, \cdots]_{1,2}}_{k\text{-fold commutator}}$$

The DSRG conditions yields a set of *polynomial equations*

$$t_a^{i,\text{new}}(s) = \left[\bar{H}_a^{i,\text{old}}(s) + t_a^{i,\text{old}}(s) \Delta_a^i \right] \frac{1 - e^{-s(\Delta_a^i)^2}}{\Delta_a^i},$$
$$t_{ab}^{ij,\text{new}}(s) = \left[\bar{H}_{ab}^{ij,\text{old}}(s) + t_{ab}^{ij,\text{old}}(s) \Delta_{ab}^{ij} \right] \frac{1 - e^{-s(\Delta_{ab}^{ij})^2}}{\Delta_{ab}^{ij}},$$

1) Yanai, T.; Chan, G. K.-L., *J. Chem. Phys.* (2006)

COMPARISON WITH OTHER METHODS

IMPLEMENTATION

Implementation based on an open-source tensor library¹

$$[A_2, B_2]_p^q \leftarrow \frac{1}{2} \sum_{iab} A_{ip}^{ab} B_{ab}^{iq} - \frac{1}{2} \sum_{ija} A_{ij}^{aq} B_{ap}^{ij}$$

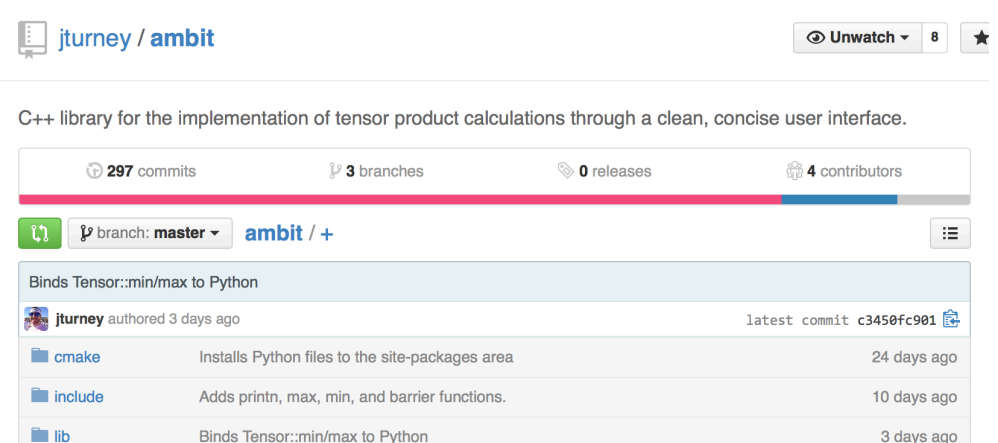

```
void TensorSRG::commutator_A2_B2_C1(BlockedTensor& A,BlockedTensor& B,BlockedTensor& C)
{
    C["qp"] += +0.5 * A["abip"] * B["iqab"];
    C["qp"] += +1.0 * A["aBpI"] * B["qIaB"];

    C["qp"] += -0.5 * A["aqij"] * B["ijap"];
    C["qp"] += -1.0 * A["qAiJ"] * B["iJpA"];

    C["QP"] += +0.5 * A["ABIP"] * B["IQAB"];
    C["QP"] += +1.0 * A["aBiP"] * B["iQaB"];

    C["QP"] += -0.5 * A["AQIJ"] * B["IJAP"];
    C["QP"] += -1.0 * A["aQij"] * B["iJaP"];
}
```

Users and developers are welcome!
See <https://github.com/jturney/ambit>

The screenshot shows the GitHub repository page for `jturney/ambit`. At the top right, there are buttons for "Unwatch", "8" (issues), and a star icon. Below the repository name, there is a description: "C++ library for the implementation of tensor product calculations through a clean, concise user interface." The repository statistics show 297 commits, 3 branches, 0 releases, and 4 contributors. The current branch is "master" and the repository is named "ambit". Below the repository information, there is a commit by "jturney" from 3 days ago with the latest commit hash "c3450fc901". The commit message is "Binds Tensor::min/max to Python". Below the commit, there is a list of files:

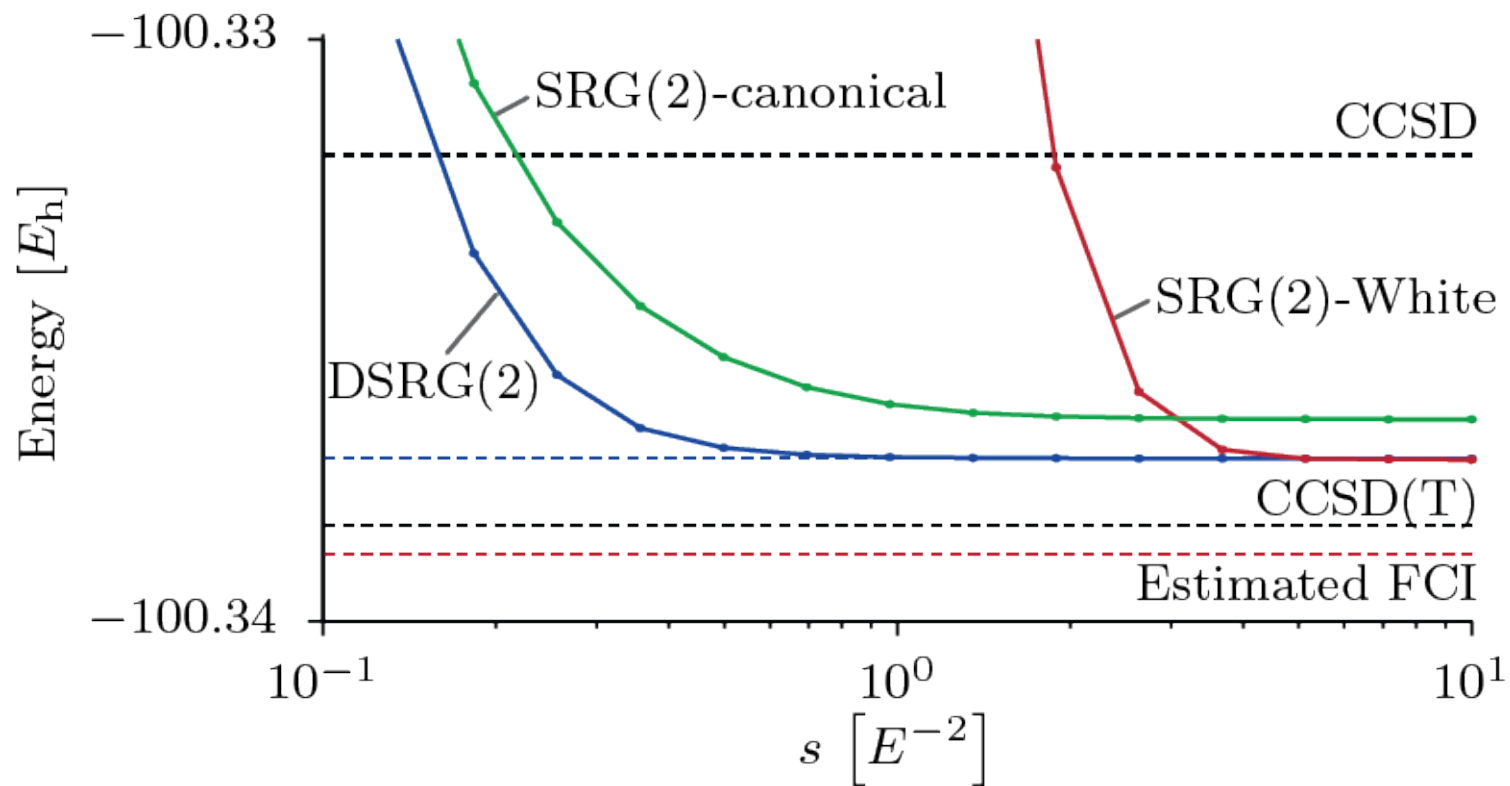

File	Description	Last Commit
<code>cmake</code>	Installs Python files to the site-packages area	24 days ago
<code>include</code>	Adds printn, max, min, and barrier functions.	10 days ago
<code>lib</code>	Binds Tensor::min/max to Python	3 days ago

EXTENSION TO THE MULTI-REFERENCE CASE: MR-DSRG¹

Based on the generalized normal ordering formalism of Mukherjee and Kutzelnigg² (also see Hergert et al.³)

$$\hat{T}_k = \frac{1}{(k!)^2} \sum_{ij\dots}^{\mathbf{H}} \sum_{ab\dots}^{\mathbf{P}} t_{ij\dots}^{ab\dots} \underbrace{\{\hat{a}_{ij\dots}^{ab\dots}\}}_{k\text{-fold excitation}} \leftarrow \text{Normal ordered with respect to } \Phi$$

1) Li, C.; Evangelista, F.A., *J. Chem. Theory Comput.* (2015)

2) Kutzelnigg, W.; Mukherjee, D. *J. Chem. Phys.* (1997)

3) Hergert, H.; Binder, S.; Calci, A.; Langhammer, J.; Roth, R., *Phys. Rev. Lett.* (2013)

SECOND-ORDER ANALYSIS OF THE MR-DSRG: DSRG-MRPT2

The zeroth-order Hamiltonian

$$\hat{F}^{(0)} = \sum_{mn}^{\mathbf{C}} f_m^n \{\hat{a}_n^m\} + \sum_{uv}^{\mathbf{A}} f_u^v \{\hat{a}_v^u\} + \sum_{ef}^{\mathbf{V}} f_e^f \{\hat{a}_f^e\} \rightarrow \sum_p^{\mathbf{C}, \mathbf{A}, \mathbf{V}} \epsilon_p \{\hat{a}_p^p\}$$

First-order amplitude equations

$$\hat{R}^{(1)}(s) = [\bar{H}^{(1)}(s)]_{\mathbf{N}} = \left(\hat{H}^{(1)} + [\hat{H}^{(0)}, \hat{A}^{(1)}(s)] \right)_{\mathbf{N}}$$

We use the single-reference source operator. This gives:

$$t_a^{i,(1)}(s) = \frac{\left[f_a^{i,(1)} + \sum_{ux}^{\mathbf{A}} \Delta_u^x t_{ax}^{iu,(1)}(s) \gamma_u^x \right] \left[1 - e^{-s(\Delta_a^i)^2} \right]}{\epsilon_i - \epsilon_a},$$

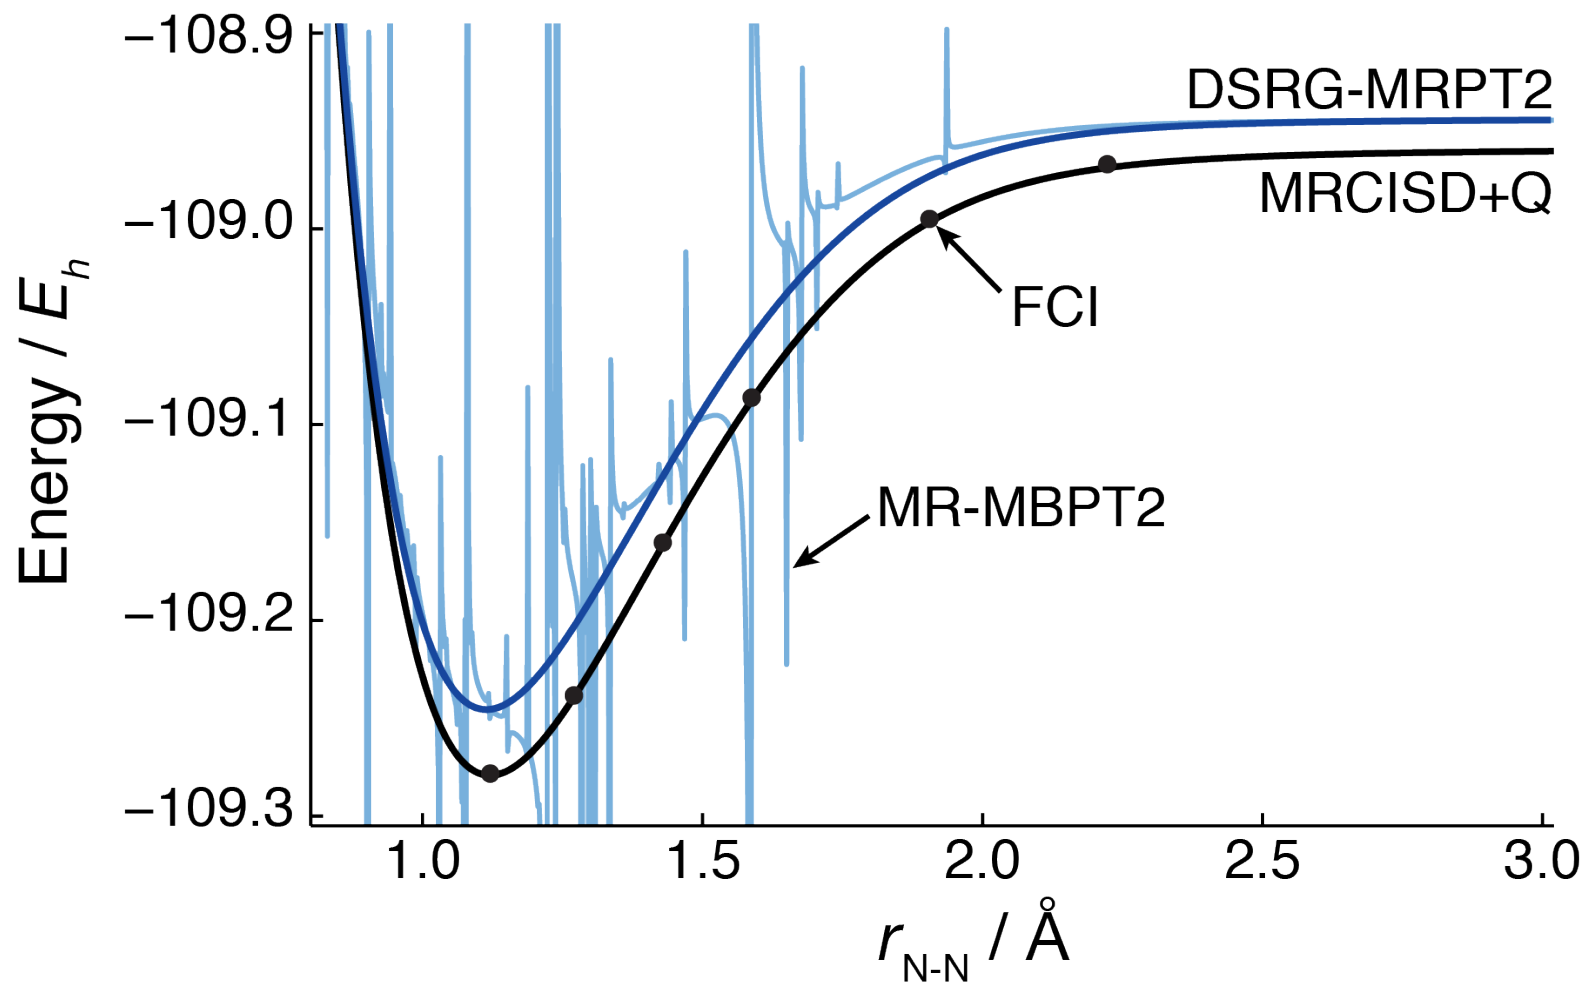

$$t_{ab}^{ij,(1)}(s) = \frac{v_{ab}^{ij,(1)} \left[1 - e^{-s(\Delta_{ab}^{ij})^2} \right]}{\epsilon_i + \epsilon_j - \epsilon_a - \epsilon_b}$$

THE SECOND-ORDER ENERGY

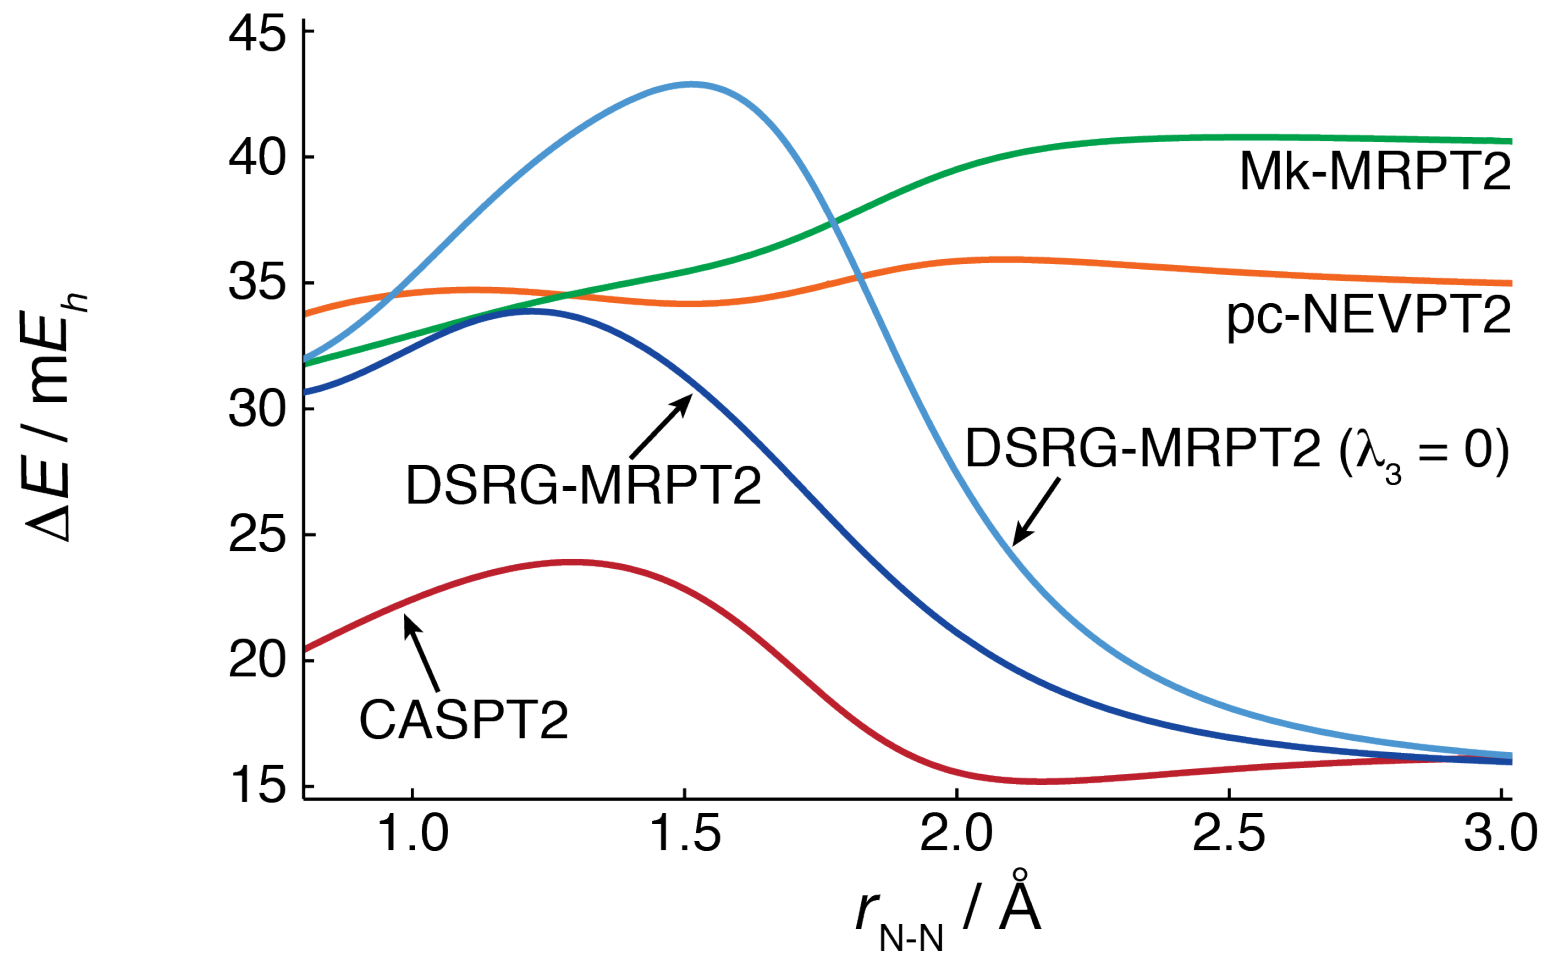

$$\begin{aligned}
 E^{(2)}(s) &= \langle \Phi | [\hat{H}^{(1)}, \hat{A}^{(1)}(s)] | \Phi \rangle \\
 &\quad + \frac{1}{2} \langle \Phi | [[\hat{H}^{(0)}, \hat{A}^{(1)}(s)], \hat{A}^{(1)}(s)] | \Phi \rangle \\
 &= \frac{1}{2} \langle \Phi | [\tilde{H}^{(1)}(s), \hat{A}^{(1)}(s)] | \Phi \rangle,
 \end{aligned}$$

$\frac{1}{2} \langle [\tilde{F}^{(1)}(s), \hat{A}_1^{(1)}(s)] \rangle$	$+ \tilde{f}_j^{b,(1)}(s) t_a^{i,(1)}(s) \gamma_i^j \eta_b^a$
$\frac{1}{2} \langle [\tilde{V}^{(1)}(s), \hat{A}_1^{(1)}(s)] \rangle$	$+ \frac{1}{2} \tilde{v}_{xy}^{ev,(1)}(s) t_e^{u,(1)}(s) \lambda_{uv}^{xy}$ $- \frac{1}{2} \tilde{v}_{my}^{uv,(1)}(s) t_x^{m,(1)}(s) \lambda_{uv}^{xy}$
$\frac{1}{2} \langle [\tilde{F}^{(1)}(s), \hat{A}_2^{(1)}(s)] \rangle$	$+ \frac{1}{2} \tilde{f}_x^{e,(1)}(s) t_{ey}^{uv,(1)}(s) \lambda_{uv}^{xy}$ $- \frac{1}{2} \tilde{f}_m^{v,(1)}(s) t_{xy}^{um,(1)}(s) \lambda_{uv}^{xy}$
$\frac{1}{2} \langle [\tilde{V}^{(1)}(s), \hat{A}_2^{(1)}(s)] \rangle$	$+ \frac{1}{4} \tilde{v}_{kl}^{cd,(1)}(s) t_{ab}^{ij,(1)}(s) \gamma_i^k \gamma_j^l \eta_c^a \eta_d^b$ $+ \frac{1}{8} \tilde{v}_{xy}^{cd,(1)}(s) t_{ab}^{uv,(1)}(s) \eta_c^a \eta_d^b \lambda_{uv}^{xy}$ $+ \frac{1}{8} \tilde{v}_{kl}^{uv,(1)}(s) t_{xy}^{ij,(1)}(s) \gamma_i^k \gamma_j^l \lambda_{uv}^{xy}$ $+ \tilde{v}_{jx}^{vb,(1)}(s) t_{ay}^{iu,(1)}(s) \gamma_i^j \eta_b^a \lambda_{uv}^{xy}$

DSRG-MRPT2 EXAMPLES: N₂ DISSOCIATION CURVE

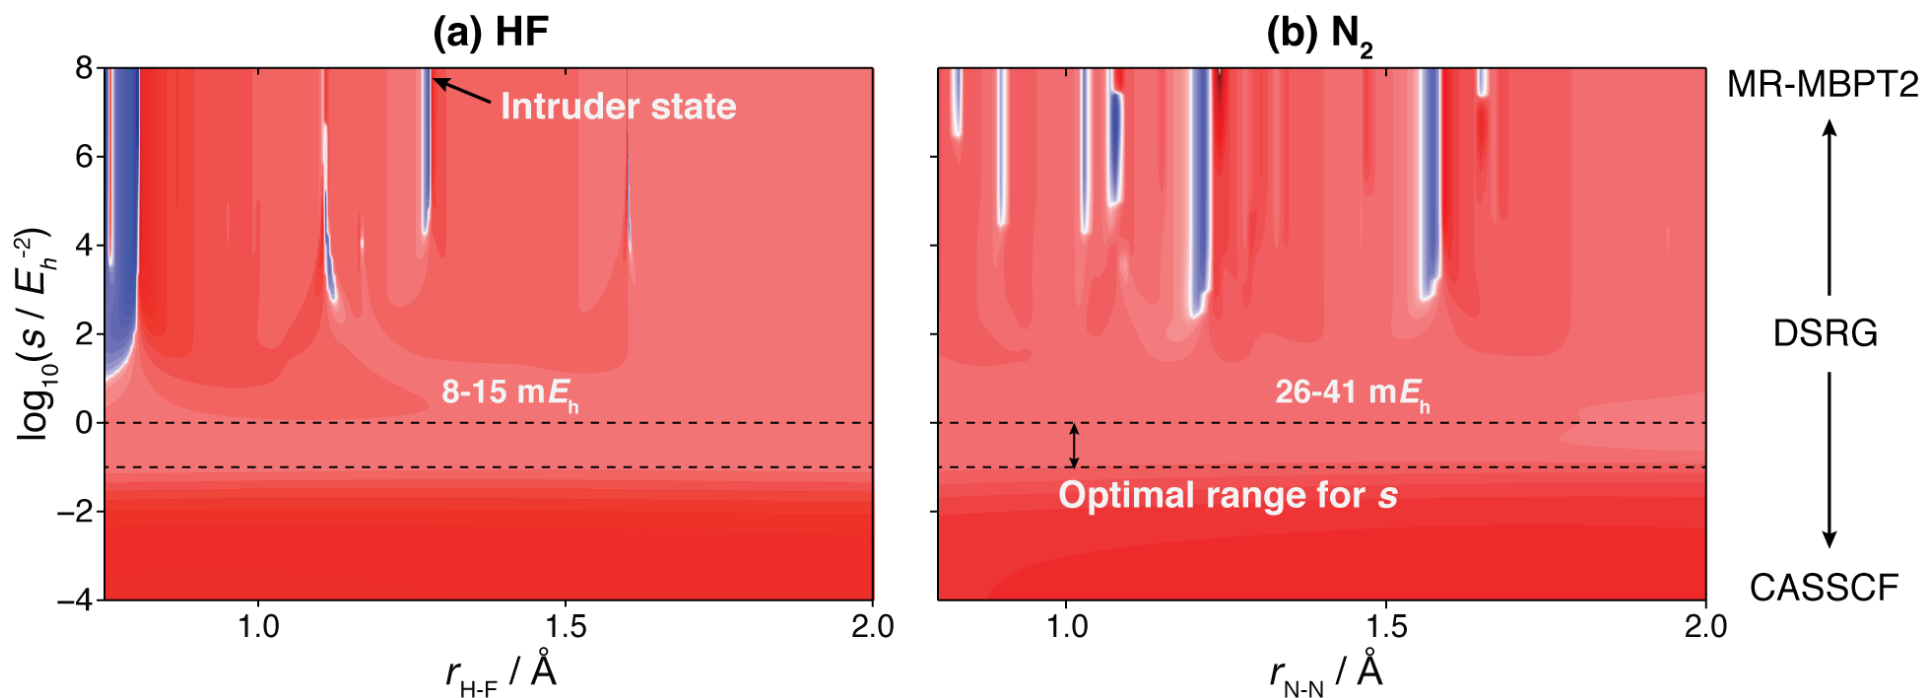

DSRG-MRPT2 EXAMPLES: N₂ DISSOCIATION CURVE

DSRG-MRPT2: DEPENDENCE OF RESULTS ON s

Error with respect to FCI (ED) as a function of s

Good News:

- It does not get worse than this.
- Can improve things: just keep many-body parts $\bar{H}(s)$

DSRG-MRPT2: FORMAL ASPECTS

Convergence:

- We are polishing a formal proof that for certain values of s the (MR-)DSRG equations are a contraction.

Orbital invariance:

- The single-reference DSRG can be made orbital invariant, expect the same to be true for the MR-DSRG.

CONCLUSIONS

The DSRG methods gives us:

- Control over the separation of static and dynamic correlation
- A numerically-robust approach to dynamic correlation
- A framework to develop adaptive theories for multireference ground states and excitation energies

Open problems:

- Can we find better ways to approximate the BCH series?
- Design of source operator, can we do better?
- Reduce the dependence of results on the value of s ?

What we are working on:

- Nonperturbative MR-DSRG
- Density-fitted implementation of the DSRG-MRPT2

$$\langle pq|rs\rangle = \sum_L (pr|L)(L|qs)$$
