Introduction

## Motivation

- Proton-neutron (pn) pairing correlations have been largely neglected in most of the calculations in nuclear structure.

[^0]
## Motivation

- Proton-neutron (pn) pairing correlations have been largely neglected in most of the calculations in nuclear structure.
- Coexistence between proton-neutron (isoscalar) and like-particle (isovector) condensates is expected to appear in $N=Z$ nuclei $^{1}$.

[^1]
## Motivation

- Proton-neutron (pn) pairing correlations have been largely neglected in most of the calculations in nuclear structure.
- Coexistence between proton-neutron (isoscalar) and like-particle (isovector) condensates is expected to appear in $N=Z$ nuclei $^{1}$.

- The aforementioned coexistence is elusive ${ }^{2}$ and "no symmetry-unrestricted mean-field calculations of pn pairing with an isospin conserving formalism have been carried out"3.

## $S O(8)$ solvable model

## Pairing Hamiltonian:

## $S O(8)$ solvable model

Pairing Hamiltonian:

$$
\begin{gather*}
\hat{H}=\overbrace{-g(1-x) \sum_{\nu} \hat{P}_{\nu}^{\dagger} \hat{P}_{\nu}}^{\text {Isovector contribution }} \underbrace{-g(1+x) \sum_{\mu} \hat{D}_{\mu}^{\dagger} \hat{D}_{\mu}}_{\text {Isoscalar contribution }} \\
\hat{P}_{\nu}^{\dagger}=\sqrt{\frac{2 l+1}{2}}\left(a_{l \frac{1}{2} \frac{1}{2}}^{\dagger} a_{l \frac{1}{2} \frac{1}{2}}^{\dagger}\right)_{M=0, S_{z}=0, T_{z}=\nu}^{L=0, S=0, T=1}  \tag{1}\\
\hat{D}_{\mu}^{\dagger}=\sqrt{\frac{2 l+1}{2}}\left(a_{l \frac{1}{2} \frac{1}{2}}^{\dagger} a_{l \frac{1}{2} \frac{1}{2}}^{\dagger}\right)_{M=0, S z=\mu, T_{z}=0}^{L=0, S=1, T=0} \tag{2}
\end{gather*}
$$

$x$ : mixing parameter, $g$ : strength of the interaction.

Mean-field description and beyond

## Hartree-Fock-Bogoliubov (HFB) formalism

Starting point: HFB calculation, by means of a transformation from the single-particle basis ( $\hat{a}, \hat{a}^{\dagger}$ ) to the quasiparticle basis $\left(\hat{\beta}, \hat{\beta}^{\dagger}\right)$

$$
\hat{\beta}_{i}^{\dagger}=\sum_{k} u_{i k} \hat{a}_{i}^{\dagger}+v_{i k} \hat{a}_{i} \longrightarrow \hat{\beta}|\Psi\rangle=0
$$

including spin and isospin mixing. By means of the Thouless theorem, we include the contribution from each correlated pair in the wavefunction

$$
\begin{equation*}
|\Psi\rangle=\mathcal{N} \exp \left(\hat{Z}^{+}\right)|0\rangle \tag{3}
\end{equation*}
$$

with

$$
\begin{equation*}
\hat{Z}^{+}=\sum_{\nu= \pm 1,0} p_{\nu} \hat{P}_{\nu}^{+}+\sum_{\mu= \pm 1,0} d_{\mu} \hat{D}_{\mu}^{+} \tag{4}
\end{equation*}
$$

## Hartree-Fock-Bogoliubov (HFB) formalism

Starting point: HFB calculation, by means of a transformation from the single-particle basis ( $\hat{a}, \hat{a}^{\dagger}$ ) to the quasiparticle basis $\left(\hat{\beta}, \hat{\beta}^{\dagger}\right)$

$$
\hat{\beta}_{i}^{\dagger}=\sum_{k} u_{i k} \hat{a}_{i}^{\dagger}+v_{i k} \hat{a}_{i} \longrightarrow \hat{\beta}|\Psi\rangle=0
$$

including spin and isospin mixing. By means of the Thouless theorem, we include the contribution from each correlated pair in the wavefunction

$$
\begin{equation*}
|\Psi\rangle=\mathcal{N} \exp \left(\hat{Z}^{+}\right)|0\rangle \tag{3}
\end{equation*}
$$

with

$$
\begin{equation*}
\hat{Z}^{+}=\sum_{\nu= \pm 1,0} p_{\nu} \hat{P}_{\nu}^{+}+\sum_{\mu= \pm 1,0} d_{\mu} \hat{D}_{\mu}^{+} \tag{4}
\end{equation*}
$$

Only axial pairs are needed

$$
\begin{equation*}
p_{0}=\sin (\alpha / 2) e^{-i \varphi}, \quad d_{0}=\cos (\alpha / 2) e^{i \varphi} \tag{5}
\end{equation*}
$$

## Hartree-Fock-Bogoliubov (HFB) formalism

Starting point: HFB calculation, by means of a transformation from the single-particle basis $\left(\hat{a}, \hat{a}^{\dagger}\right)$ to the quasiparticle basis ( $\hat{\beta}, \hat{\beta}^{\dagger}$ )

$$
\hat{\beta}_{i}^{\dagger}=\sum_{k} u_{i k} \hat{a}_{i}^{\dagger}+v_{i k} \hat{a}_{i} \longrightarrow \hat{\beta}|\Psi\rangle=0
$$

including spin and isospin mixing. By means of the Thouless theorem, we include the contribution from each correlated pair in the wavefunction

$$
\begin{equation*}
|\Psi\rangle=\mathcal{N} \exp \left(\hat{Z}^{+}\right)|0\rangle \tag{3}
\end{equation*}
$$

with

$$
\begin{equation*}
\hat{Z}^{+}=\sum_{\nu= \pm 1,0} p_{\nu} \hat{P}_{\nu}^{+}+\sum_{\mu= \pm 1,0} d_{\mu} \hat{D}_{\mu}^{+} \tag{4}
\end{equation*}
$$

Only axial pairs are needed

$$
\begin{equation*}
p_{0}=\sin (\alpha / 2) e^{-i \varphi}, \quad d_{0}=\cos (\alpha / 2) e^{i \varphi} \tag{5}
\end{equation*}
$$

The resulting HFB energy being $E=\langle\Psi| \hat{H}|\Psi\rangle$

## HFB results ${ }^{4}$

Figure 1: Energy (arbitrary units) as a function of the tuning parameter $x$ for a model-space with $l=2, A=12$ obtained from the HFB and exact solutions.

## HFB results

Figure 2: Normalised "number of pairs" as a function of the tuning parameter $x$ computed using the HFB method.

## Beyond mean-field: restoration of broken symmetries

The quasiparticle vacuum $|\Psi\rangle$ is a superposition of states with good particle ( $A$ ), spin ( $S$ ) and isospin ( $T$ ) numbers, $|\Psi\rangle=\sum_{A S T} c_{A S T}|A S T\rangle$, leading to broken symmetries.

## Beyond mean-field: restoration of broken symmetries

The quasiparticle vacuum $|\Psi\rangle$ is a superposition of states with good particle $(A)$, spin $(S)$ and isospin $(T)$ numbers, $|\Psi\rangle=\sum_{A S T} c_{A S T}|A S T\rangle$, leading to broken symmetries. By means of projection methods, these symmetries can be restored,

$$
|A S T\rangle=\hat{P}^{A} \hat{P}^{S} \hat{P}^{T}|\Psi\rangle
$$

with

$$
\begin{gather*}
\hat{P}^{A}|\Psi\rangle=\frac{1}{2 \pi} \int_{0}^{2 \pi} d \varphi e^{i \varphi(\hat{A}-A)}|\Psi\rangle  \tag{6}\\
\hat{P}_{S_{z}^{\prime} S_{z}}^{S}|\Psi\rangle=\frac{2 S+1}{8 \pi^{2}} \int d \Omega_{S} D_{S_{z}^{\prime} S_{z}}^{S *}\left(\Omega_{S}\right) \hat{R}\left(\Omega_{S}\right)|\Psi\rangle  \tag{7}\\
\hat{P}_{T_{z}^{\prime} T_{z}}^{T}|\Psi\rangle=\frac{2 T+1}{8 \pi^{2}} \int d \Omega_{T} D_{T_{z}^{\prime} T_{z}}^{T *}\left(\Omega_{T}\right) \hat{R}\left(\Omega_{T}\right)|\Psi\rangle \tag{8}
\end{gather*}
$$

## Beyond mean-field: restoration of broken symmetries

The quasiparticle vacuum $|\Psi\rangle$ is a superposition of states with good particle ( $A$ ), spin ( $S$ ) and isospin ( $T$ ) numbers, $|\Psi\rangle=\sum_{A S T} c_{A S T}|A S T\rangle$, leading to broken symmetries. By means of projection methods, these symmetries can be restored,

$$
|A S T\rangle=\hat{P}^{A} \hat{P}^{S} \hat{P}^{T}|\Psi\rangle
$$

with

$$
\begin{gather*}
\hat{P}^{A}|\Psi\rangle=\frac{1}{2 \pi} \int_{0}^{2 \pi} d \varphi e^{i \varphi(\hat{A}-A)}|\Psi\rangle  \tag{6}\\
\hat{P}_{S_{z}^{\prime} S_{z}}^{S}|\Psi\rangle=\frac{2 S+1}{8 \pi^{2}} \int d \Omega_{S} D_{S_{z}^{\prime} S_{z}}^{S *}\left(\Omega_{S}\right) \hat{R}\left(\Omega_{S}\right)|\Psi\rangle  \tag{7}\\
\hat{P}_{T_{z}^{\prime} T_{z}}^{T}|\Psi\rangle=\frac{2 T+1}{8 \pi^{2}} \int d \Omega_{T} D_{T_{z}^{\prime} T_{z}}^{T *}\left(\Omega_{T}\right) \hat{R}\left(\Omega_{T}\right)|\Psi\rangle \tag{8}
\end{gather*}
$$

and the "projected energy" is calculated as

$$
E_{\text {proj }}=\frac{\langle\Psi| \hat{H}|A S T\rangle}{\langle\Psi \mid A S T\rangle}
$$

## Choice: variate, then project; or project, then variate?

We find two options to perform beyond mean-field calculations,

- Projection after variation (PAV):

$$
\left.\delta \frac{\langle\Psi| \hat{H}|\Psi\rangle}{\langle\Psi \mid \Psi\rangle}\right|_{\left|\Psi_{\mathrm{PAV}}\right\rangle}=0 \longrightarrow E_{\mathrm{proj}}^{\mathrm{PAV}}=\frac{\left\langle\Psi_{\mathrm{PAV}}\right| \hat{H}|A S T\rangle}{\left\langle\Psi_{\mathrm{PAV}} \mid A S T\right\rangle}
$$

- Variation after projection (VAP):

$$
\left.\delta \frac{\langle\Psi| \hat{H}|A S T\rangle}{\langle\Psi \mid A S T\rangle}\right|_{\left|\Psi_{\mathrm{VAP}}\right\rangle}=0 \longrightarrow E_{\mathrm{proj}}^{\mathrm{VAP}}=\frac{\left\langle\Psi_{\mathrm{VAP}}\right| \hat{H}|A S T\rangle}{\left\langle\Psi_{\mathrm{VAP}} \mid A S T\right\rangle}
$$

## Choice: variate, then project; or project, then variate?

We find two options to perform beyond mean-field calculations,

- Projection after variation (PAV):

$$
\left.\delta \frac{\langle\Psi| \hat{H}|\Psi\rangle}{\langle\Psi \mid \Psi\rangle}\right|_{\left|\Psi_{\mathrm{PAV}}\right\rangle}=0 \longrightarrow E_{\mathrm{proj}}^{\mathrm{PAV}}=\frac{\left\langle\Psi_{\mathrm{PAV}}\right| \hat{H}|A S T\rangle}{\left\langle\Psi_{\mathrm{PAV}} \mid A S T\right\rangle}
$$

- Variation after projection (VAP):

$$
\left.\delta \frac{\langle\Psi| \hat{H}|A S T\rangle}{\langle\Psi \mid A S T\rangle}\right|_{\left|\Psi_{\mathrm{VAP}}\right\rangle}=0 \longrightarrow E_{\mathrm{proj}}^{\mathrm{VAP}}=\frac{\left\langle\Psi_{\mathrm{VAP}}\right| \hat{H}|A S T\rangle}{\left\langle\Psi_{\mathrm{VAP}} \mid A S T\right\rangle}
$$

As these methods rely upon the variational principle, the VAP approach should perform better.

## Signature of the states

- States of good quantum numbers $|A S T\rangle$ are also eigenstates of the signature operators in spin and isospin space

$$
\begin{equation*}
\hat{R}_{S}(\pi)=e^{-i \pi \hat{S}_{y}} \quad \hat{R}_{T}(\pi)=e^{-i \pi \hat{T}_{y}} \tag{9}
\end{equation*}
$$

## Signature of the states

- States of good quantum numbers $|A S T\rangle$ are also eigenstates of the signature operators in spin and isospin space

$$
\begin{equation*}
\hat{R}_{S}(\pi)=e^{-i \pi \hat{S}_{y}} \quad \hat{R}_{T}(\pi)=e^{-i \pi \hat{T}_{y}} \tag{9}
\end{equation*}
$$

- Signature of axial (projection zero) states:

$$
\begin{equation*}
\hat{R}_{S}(\pi) \hat{R}_{T}(\pi)|S T\rangle=(-1)^{S+T}|S T\rangle \tag{10}
\end{equation*}
$$

## Signature of the states

- States of good quantum numbers $|A S T\rangle$ are also eigenstates of the signature operators in spin and isospin space

$$
\begin{equation*}
\hat{R}_{S}(\pi)=e^{-i \pi \hat{S}_{y}} \quad \hat{R}_{T}(\pi)=e^{-i \pi \hat{T}_{y}} \tag{9}
\end{equation*}
$$

- Signature of axial (projection zero) states:

$$
\begin{equation*}
\hat{R}_{S}(\pi) \hat{R}_{T}(\pi)|S T\rangle=(-1)^{S+T}|S T\rangle \tag{10}
\end{equation*}
$$

- Signature of particle-number projected states:

$$
\begin{equation*}
\hat{R}_{S}(\pi) \hat{R}_{T}(\pi)|A\rangle=\hat{R}_{S}(\pi) \hat{R}_{T}(\pi) \frac{\left(\hat{Z}^{+}\right)^{A / 2}}{(A / 2)!}|0\rangle=(-1)^{A / 2}|A\rangle \tag{11}
\end{equation*}
$$

## Signature of the states

- States of good quantum numbers $|A S T\rangle$ are also eigenstates of the signature operators in spin and isospin space

$$
\begin{equation*}
\hat{R}_{S}(\pi)=e^{-i \pi \hat{S}_{y}} \quad \hat{R}_{T}(\pi)=e^{-i \pi \hat{T}_{y}} \tag{9}
\end{equation*}
$$

- Signature of axial (projection zero) states:

$$
\begin{equation*}
\hat{R}_{S}(\pi) \hat{R}_{T}(\pi)|S T\rangle=(-1)^{S+T}|S T\rangle \tag{10}
\end{equation*}
$$

- Signature of particle-number projected states:

$$
\begin{equation*}
\hat{R}_{S}(\pi) \hat{R}_{T}(\pi)|A\rangle=\hat{R}_{S}(\pi) \hat{R}_{T}(\pi) \frac{\left(\hat{Z}^{+}\right)^{A / 2}}{(A / 2)!}|0\rangle=(-1)^{A / 2}|A\rangle \tag{11}
\end{equation*}
$$

- Therefore

$$
\begin{align*}
\hat{R}_{S}(\pi) \hat{R}_{T}(\pi)|A S T\rangle & =(-1)^{A / 2}|A S T\rangle \\
& =(-1)^{S+T}|A S T\rangle \tag{12}
\end{align*}
$$

## Signature of the states

- States of good quantum numbers $|A S T\rangle$ are also eigenstates of the signature operators in spin and isospin space

$$
\begin{equation*}
\hat{R}_{S}(\pi)=e^{-i \pi \hat{S}_{y}} \quad \hat{R}_{T}(\pi)=e^{-i \pi \hat{T}_{y}} \tag{9}
\end{equation*}
$$

- Signature of axial (projection zero) states:

$$
\begin{equation*}
\hat{R}_{S}(\pi) \hat{R}_{T}(\pi)|S T\rangle=(-1)^{S+T}|S T\rangle \tag{10}
\end{equation*}
$$

- Signature of particle-number projected states:

$$
\begin{equation*}
\hat{R}_{S}(\pi) \hat{R}_{T}(\pi)|A\rangle=\hat{R}_{S}(\pi) \hat{R}_{T}(\pi) \frac{\left(\hat{Z}^{+}\right)^{A / 2}}{(A / 2)!}|0\rangle=(-1)^{A / 2}|A\rangle \tag{11}
\end{equation*}
$$

- Therefore

$$
\begin{align*}
\hat{R}_{S}(\pi) \hat{R}_{T}(\pi)|A S T\rangle & =(-1)^{A / 2}|A S T\rangle \\
& =(-1)^{S+T}|A S T\rangle \tag{12}
\end{align*}
$$

- Selection rule for the projected states:
- If $S+T=$ even $\longrightarrow A / 2=$ even
- If $S+T=$ odd $\longrightarrow A / 2=$ odd

## Results

## Results

Figure 3: HFB (top) and VAP (bottom) energy (arbitrary units) surface as a function of the parameters $\alpha$ and $\varphi$ for different values $x$ of the interaction, for $S=T=0$ and for a model-space with $\Omega=\sum_{l}(2 l+1)=12, A=24$. Steps of $\Delta E=20,15,13,17$ and 20 , respectively.

## Energy

Figure 4: Energy (arbitrary units) as a function of the tuning parameter $x$ for a model space with spatial degeneracy $\Omega=12$ and $A=24, S=T=0$, obtained for HFB, PAV and VAP methods and comparing them to the exact solutions.

## Energy: exact and VAP comparison

$$

## Projection gives exact states!

For $A=4, S=T=0$, there are only two possible configurations:

## Projection gives exact states!

For $A=4, S=T=0$, there are only two possible configurations:

$$
\begin{equation*}
|A=4, S=T=0\rangle=\left[\alpha\left(\hat{P}^{+} \hat{P}^{+}\right)^{S=0, T=0}+\beta\left(\hat{D}^{+} \hat{D}^{+}\right)^{S=0, T=0}\right]|0\rangle \tag{13}
\end{equation*}
$$

## Projection gives exact states!

For $A=4, S=T=0$, there are only two possible configurations:

$$
\begin{equation*}
|A=4, S=T=0\rangle=\left[\alpha\left(\hat{P}^{+} \hat{P}^{+}\right)^{S=0, T=0}+\beta\left(\hat{D}^{+} \hat{D}^{+}\right)^{S=0, T=0}\right]|0\rangle \tag{13}
\end{equation*}
$$

For $A=6$,

$$
\begin{equation*}
|A=6, S=1, T=0\rangle=\hat{D}_{0}^{+}|A=4, S=T=0\rangle \tag{14}
\end{equation*}
$$

## Projection gives exact states!

For $A=4, S=T=0$, there are only two possible configurations:

$$
\begin{equation*}
|A=4, S=T=0\rangle=\left[\alpha\left(\hat{P}^{+} \hat{P}^{+}\right)^{S=0, T=0}+\beta\left(\hat{D}^{+} \hat{D}^{+}\right)^{S=0, T=0}\right]|0\rangle \tag{13}
\end{equation*}
$$

For $A=6$,

$$
\begin{equation*}
|A=6, S=1, T=0\rangle=\hat{D}_{0}^{+}|A=4, S=T=0\rangle \tag{14}
\end{equation*}
$$

No longer true for $A>6$. It is not possible to describe those states entirely with our isoscalar and isovector pairs.

## Importance of the separate symmetry restorations

Figure 6: HFB (first row), particle-number restored (second row), spin plus isospin restored (third row) and particle number, spin and isospin restored (fourth row) energy surfaces.

## Separable pairing

## Realistic separable interaction in the pairing channel

$$
\begin{align*}
V\left(\boldsymbol{r}_{\mathbf{1}}, \boldsymbol{r}_{\mathbf{2}} ; \boldsymbol{r}_{\mathbf{1}}^{\prime}, \boldsymbol{r}_{\mathbf{2}}^{\prime}\right) & =-\delta\left(X-X^{\prime}\right) \delta\left(Y-Y^{\prime}\right) \delta\left(Z-Z^{\prime}\right) \\
& \times P(x) P(y) P(z) P\left(x^{\prime}\right) P\left(y^{\prime}\right) P\left(z^{\prime}\right)  \tag{15}\\
& \times\left[W+B P^{\sigma}-H P^{\tau}-M P^{\sigma} P^{\tau}\right]
\end{align*}
$$

where $\boldsymbol{r}_{\boldsymbol{i}}=\left(x_{i}, y_{i}, z_{i}\right), x=x_{1}-x_{2}$ and $X=\frac{1}{2}\left(x_{1}+x_{2}\right)$. The interaction is modelled by a Gaussian

$$
\begin{equation*}
P(x)=\frac{1}{\sqrt{4 \pi} a} e^{-x^{2} /\left(4 a^{2}\right)} \tag{16}
\end{equation*}
$$

## Realistic separable interaction in the pairing channel

$$
\begin{align*}
V\left(\boldsymbol{r}_{\mathbf{1}}, \boldsymbol{r}_{\mathbf{2}} ; \boldsymbol{r}_{\mathbf{1}}^{\prime}, \boldsymbol{r}_{\mathbf{2}}^{\prime}\right) & =-\delta\left(X-X^{\prime}\right) \delta\left(Y-Y^{\prime}\right) \delta\left(Z-Z^{\prime}\right) \\

Followed by implementation of isoscalar pairing and the symmetry-restoration methodology.

## Conclusions

## Summary and ongoing work

- Symmetry-restored mean-field techniques accurately describes the exact solution within a simple $S O(8)$ pairing interaction model and the coexistence of the isoscalar and isovector pair condensates.

## Summary and ongoing work

- Symmetry-restored mean-field techniques accurately describes the exact solution within a simple $S O(8)$ pairing interaction model and the coexistence of the isoscalar and isovector pair condensates.
- Restoration of both angular momentum and isospin seems to be of crucial importance for the description of pairing coexistence.

## Summary and ongoing work

- Symmetry-restored mean-field techniques accurately describes the exact solution within a simple $S O(8)$ pairing interaction model and the coexistence of the isoscalar and isovector pair condensates.
- Restoration of both angular momentum and isospin seems to be of crucial importance for the description of pairing coexistence.
- Further studies are to be carried out using realistic interactions and shell structure settings.

## Thank you for your attention.
