

## 4th International Workshop on Quantitative Challenges in Short-Range Correlations and the EMC Effect Research

30 January 2023 to 3 February 2023  
CEA Paris-Saclay

# SIDIS study @ CLAS12

**Erez O. Cohen,**

Ofer Aviv, Dien T. Nguyen, Florian Hauenstein, Igor Korover,

Or Hen, Eli Piassetzky

Feb-03, 2023

Jefferson Lab

- We study  $\pi^+/\pi^-$  SIDIS cross-section ratio off  $d$  (and  $p$ ) with & without tagging on SRC

- low  $Q^2$  : consistent with published data

- high  $Q^2$ : approach Parton model

- Based on Parton model we extract  $u/d$  for  $p$

- We study fragmentation at large  $p_T$

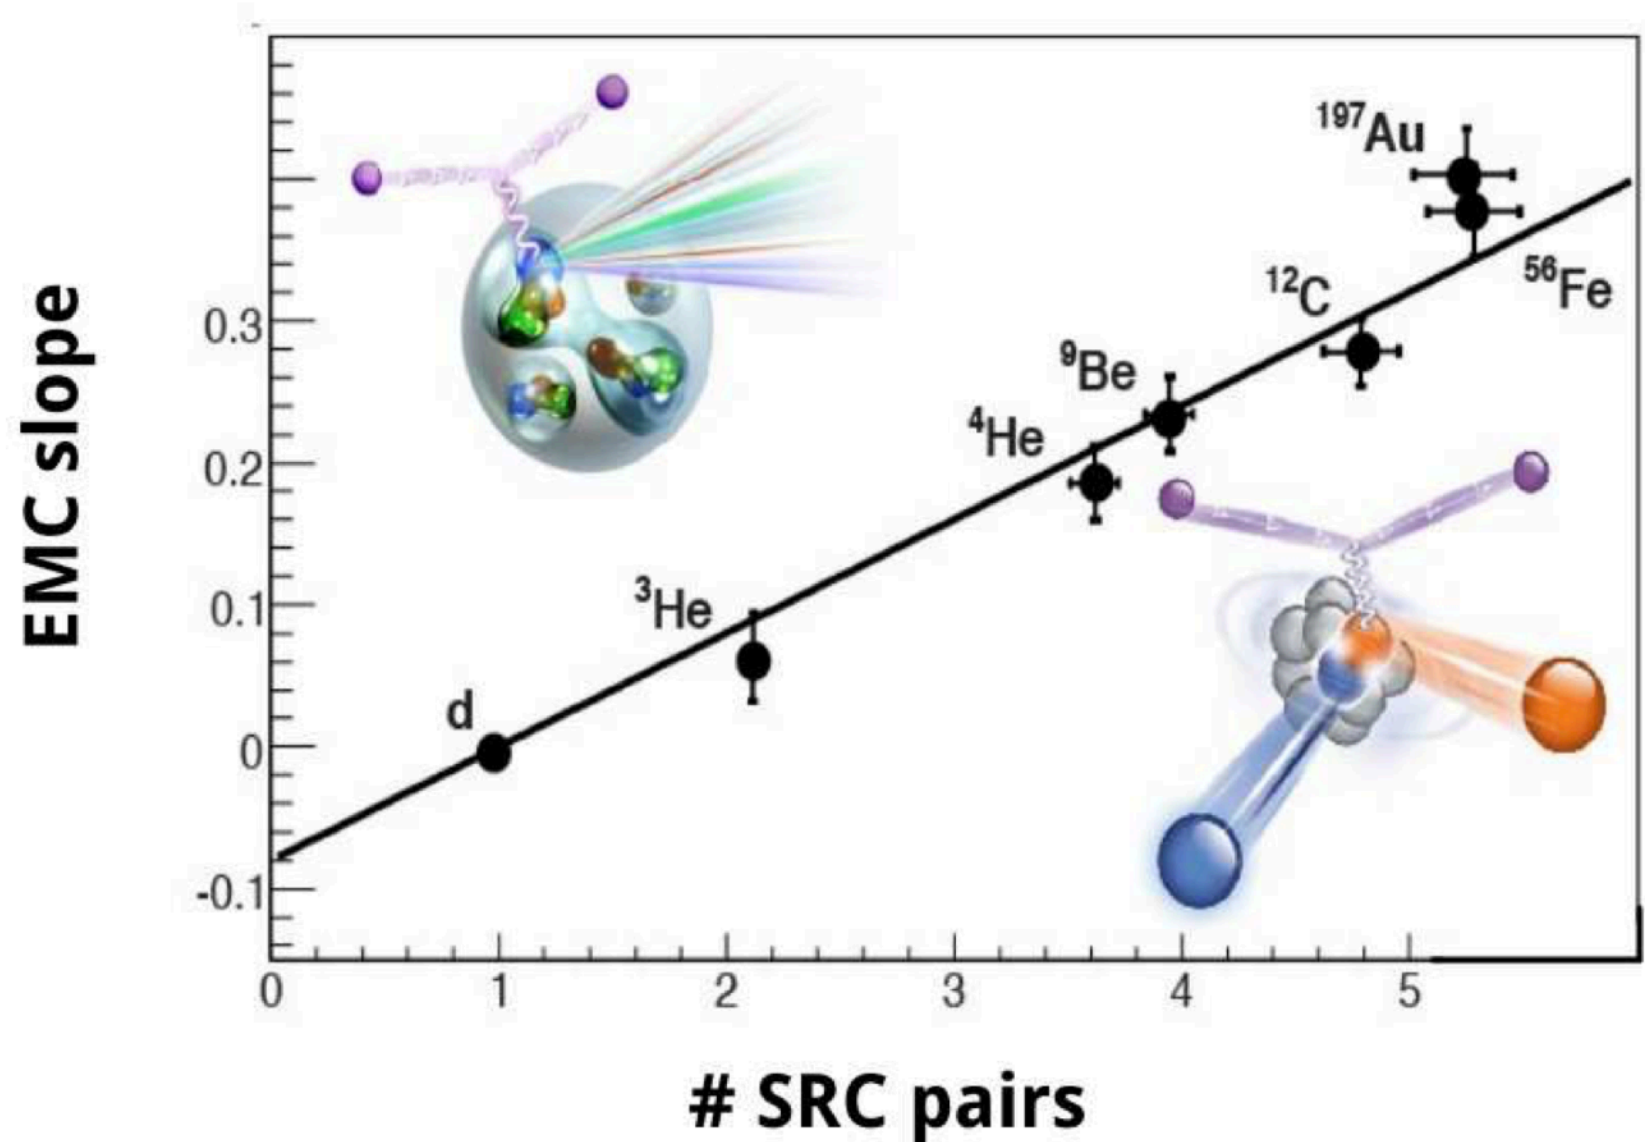

# DIS $\pi^+/\pi^-$ production cross-section ratio

- PDFs of  $u$  and  $d$  in a bound  $p$  are potentially different from those in free  $p$
- Structure modification can be associated with  $u$  or  $d$  using  $\pi^+/\pi^-$  production cross-section ratio at high  $z$   
( $\pi^+$  is  $u\bar{d}$ ,  $\pi^-$  is  $d\bar{u}$ )

# EMC/SRC study in

- Some of the modification can be attributed to SRC
- We study this ratio for a “tagged  $p$ ” from a SRC pairs (using a deuteron with CLAS)

L. Weinstein, et al., PRL 106, 052301 (2011)

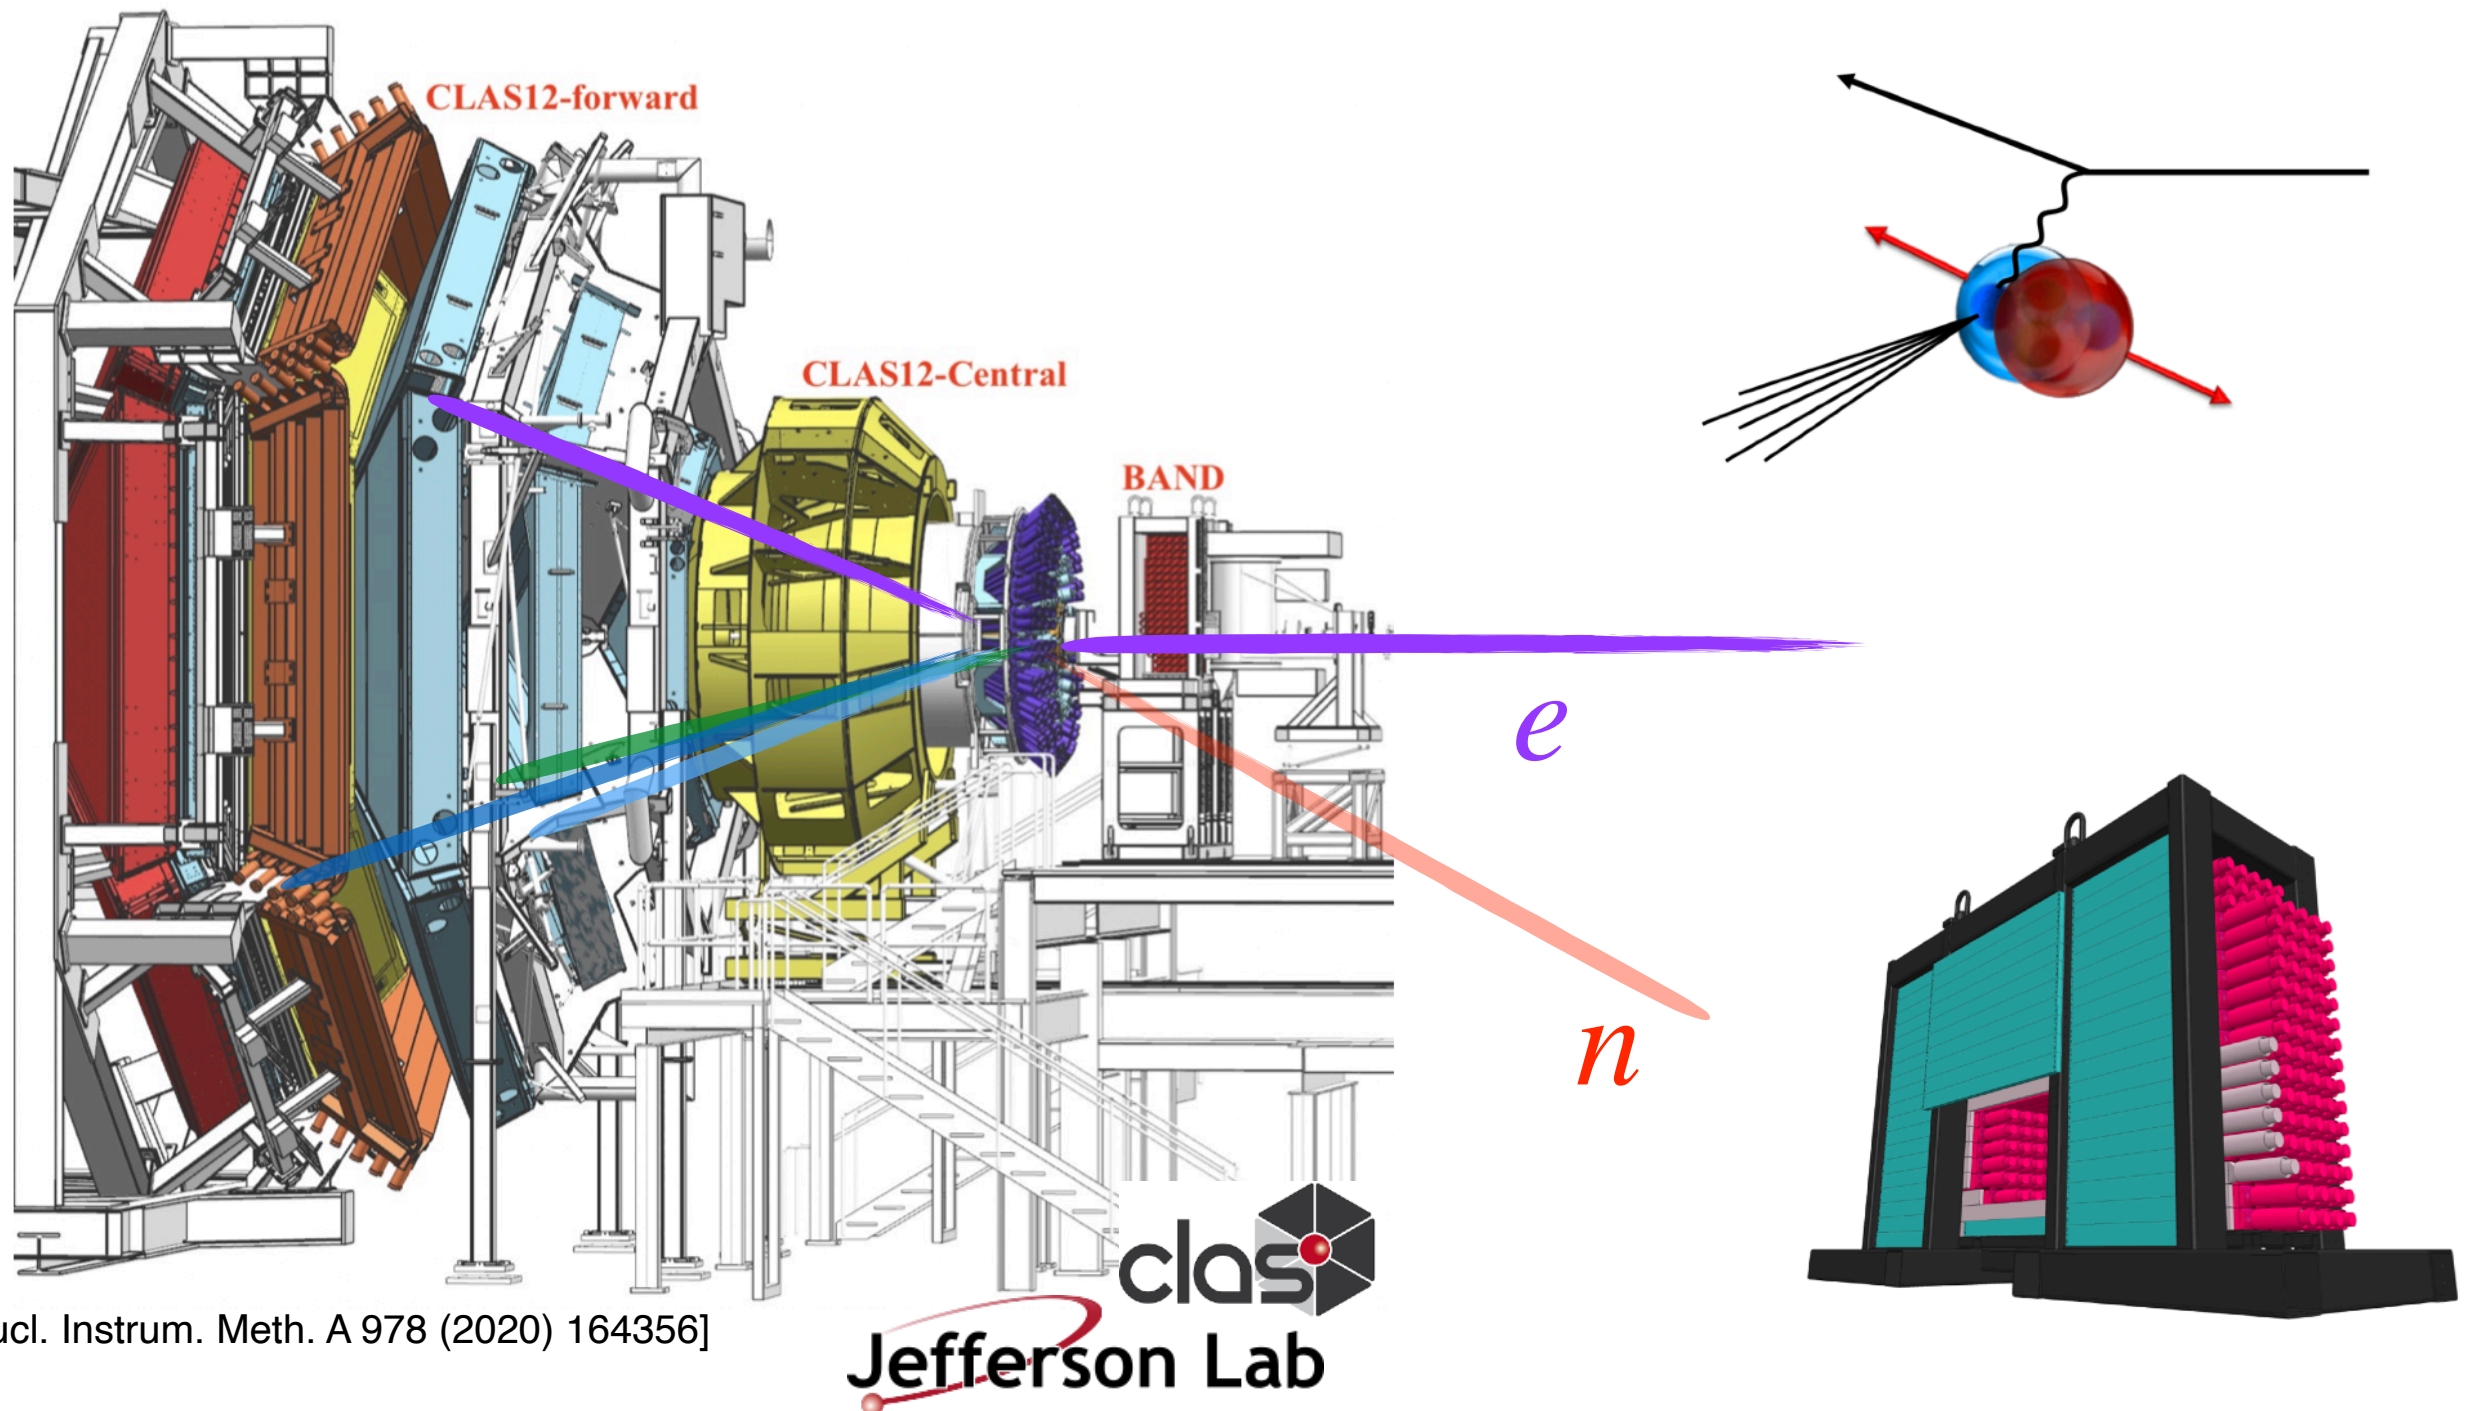

O. Hen, et al., PRC 85, 047301 (2012)

J. Arrington, et al., PRC 86, 065204 (2012)

# SRC-tagged SIDIS with CLAS + BAND

- BAND is a dedicated detector to tag SRC events with a backward recoiling neutron

# SRC-tagged SIDIS with CLAS + BAND

RGB data

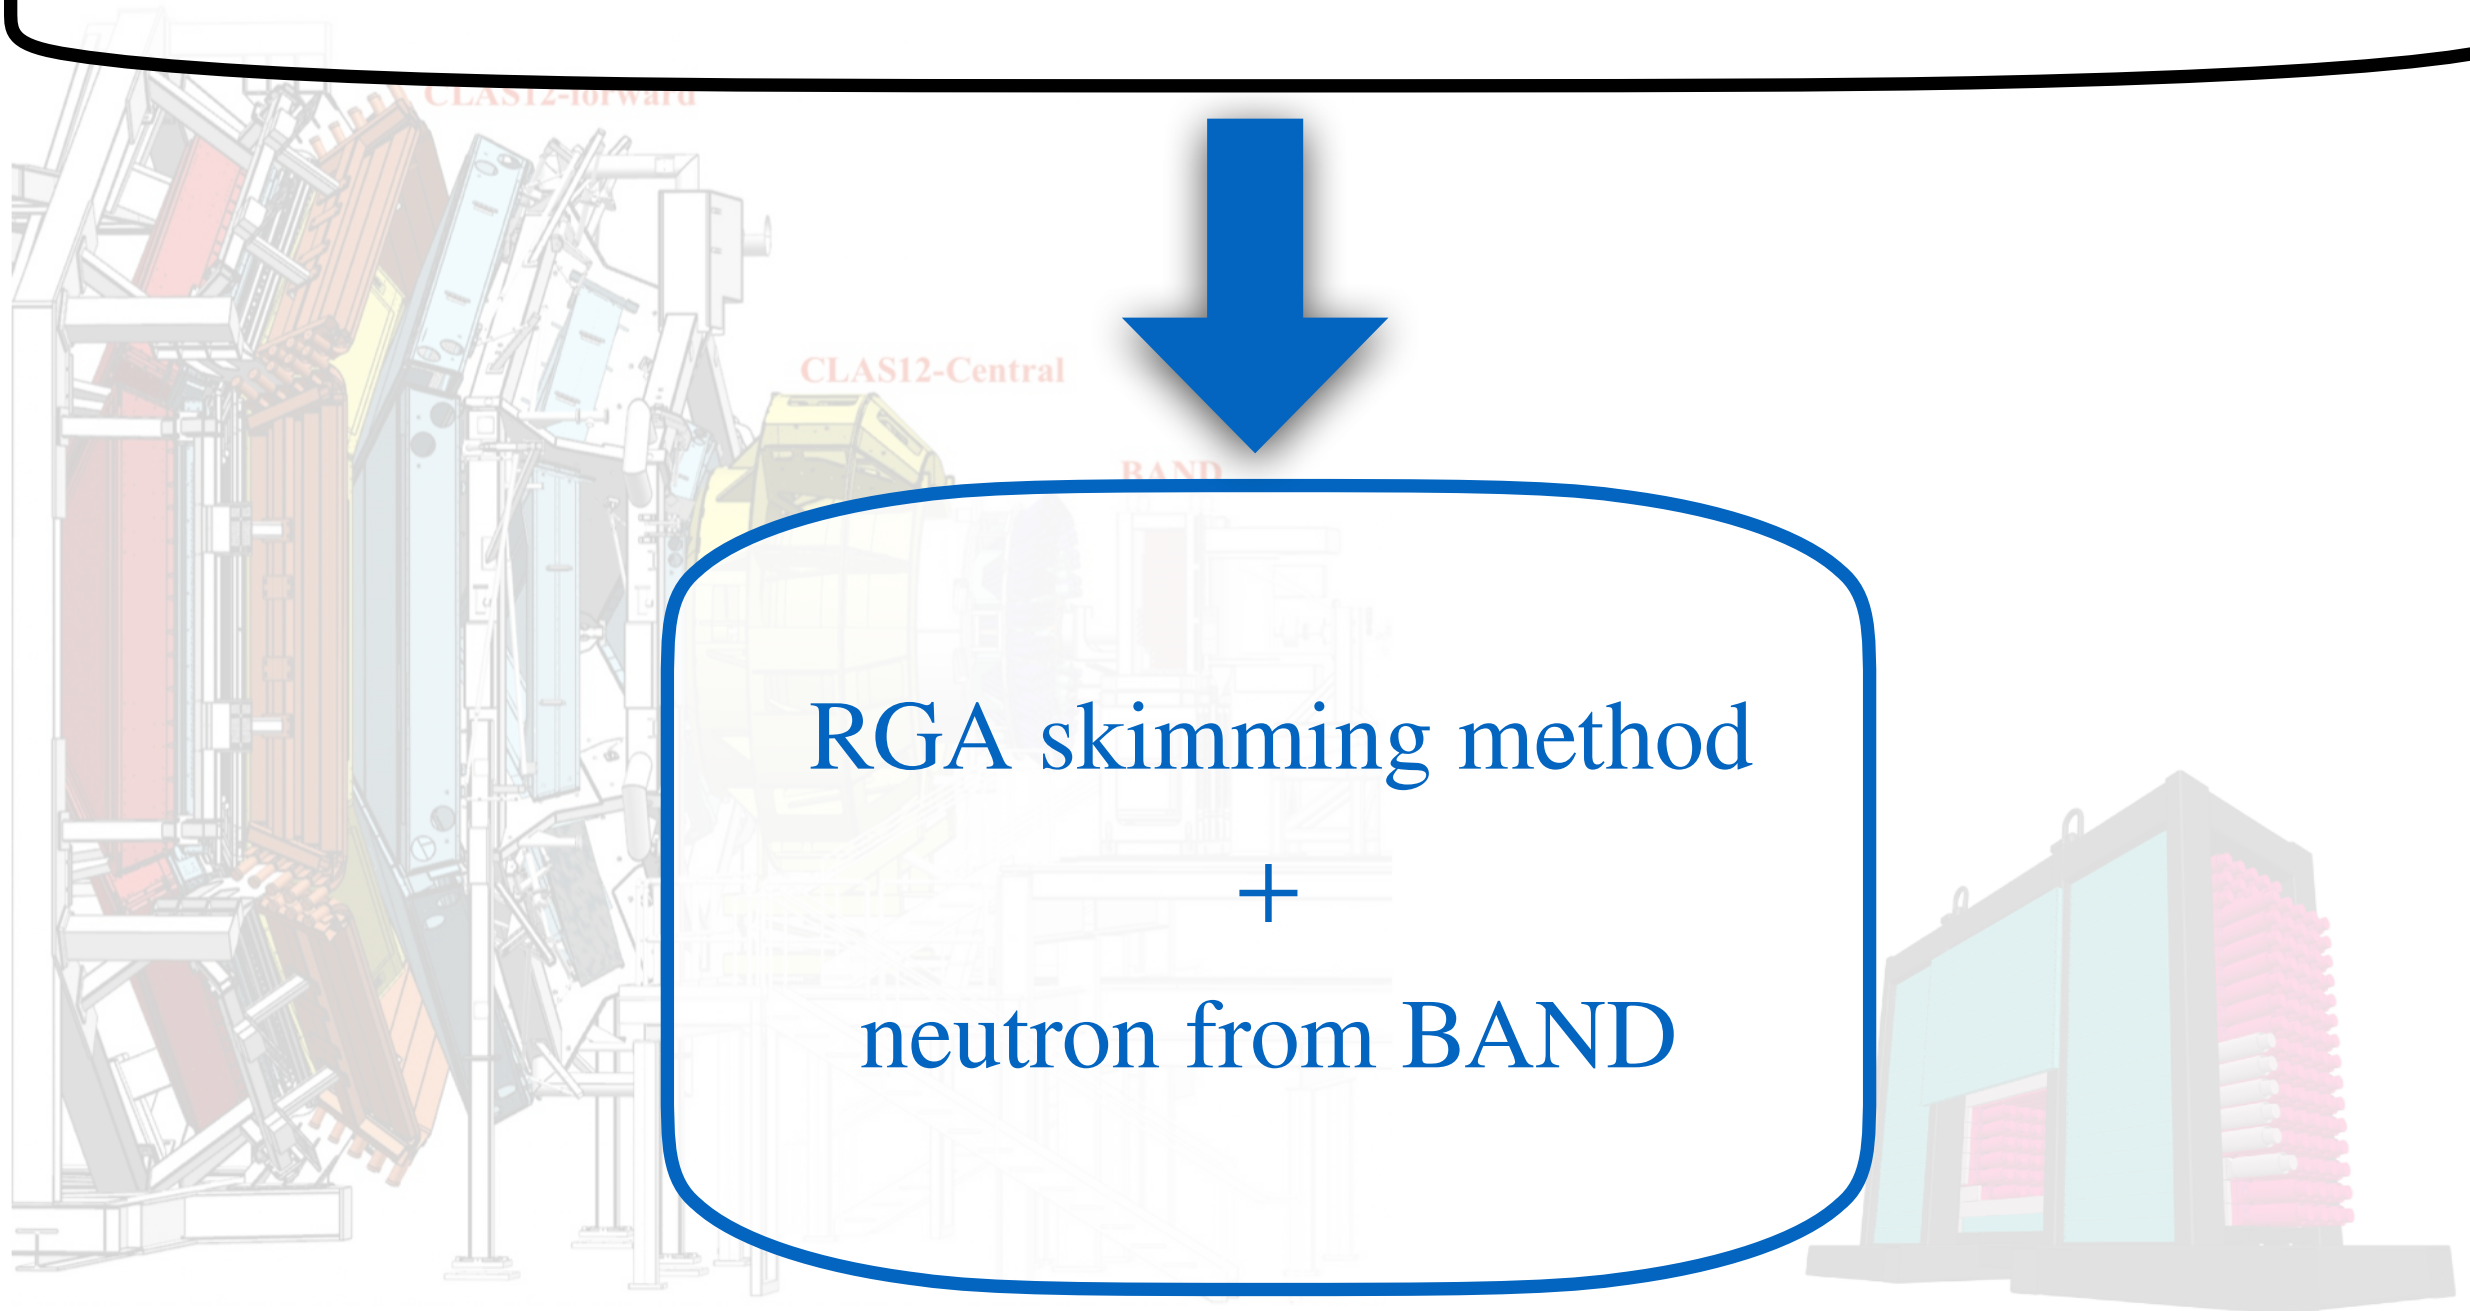

Requirement:  $(e, e'\pi)$  events with fast  $n$  recoil to BAND

RGAs skimming method

+

neutron from BAND

# Event selection criteria - Tagged SIDIS

## DIS

- ◆  $e$  and  $\pi$  Particle ID
  - ◆  $e$  and  $\pi$  fiducial cuts (PCAL, DC)
  - ◆ Calorimetry energy deposition
  - ◆  $5^\circ < \theta_e, \theta_\pi < 35^\circ$
  - ◆  $|v_z^e - v_z^\pi| < 20$  cm
  - ◆  $1.25 < p_\pi < 5.0$  GeV/c ( $\pi/K$  separation)
  - ◆  $0.3 < z < 1.0$
- ◆  $2 (\text{GeV}/c)^2 < Q^2$
  - ◆  $2.5 \text{ GeV}/c^2 < W$
  - ◆  $y = \frac{\omega}{E_{beam}} < 0.75$  (avoid QE)

Approved PID developed by  
RGA SIDIS group

- ◆  $\pi^+/\pi^-$  acceptance matching in  $p - \theta$
- ◆  $1.3 \text{ GeV}/c^2 < M_x$

“Cleaning” the event-sample

## Neutrons in BAND

- ◆ “Good -  $n$ ” cluster algorithm
- ◆ Fiducial cuts
- ◆  $5 \text{ MeV} < \Delta E_{dep}$
- ◆ Cut on top TOF bars in BAND
- ◆  $0.275 \text{ GeV}/c < p_n$

BAND analysis

# SIDIS off the (SRC part in the) deuteron

- We are studying the  $\pi^+/\pi^-$  cross-section ratio

- Goal: SRC-tagged ratio

$$\frac{\sigma_{d(e,e'\pi^+n)}}{\sigma_{d(e,e'\pi^-n)}}$$

Mainly scatter off a high-virtuality  $p$  in  $np$ -SRC

- 1<sup>st</sup> step: untagged ratio

$$\frac{\sigma_{d(e,e'\pi^+)}}{\sigma_{d(e,e'\pi^-)}}$$

Scatter off  $n$  or  $p$  in  $d$

# SIDIS off the (SRC part in the) deuteron

SRC-tagged data

1.7 k events  $\longrightarrow$   $\frac{\sigma_{d(e,e'\pi^+n)}}{\sigma_{d(e,e'\pi^-n)}}$

0.8 k  $\longrightarrow$   $\sigma_{d(e,e'\pi^-n)}$

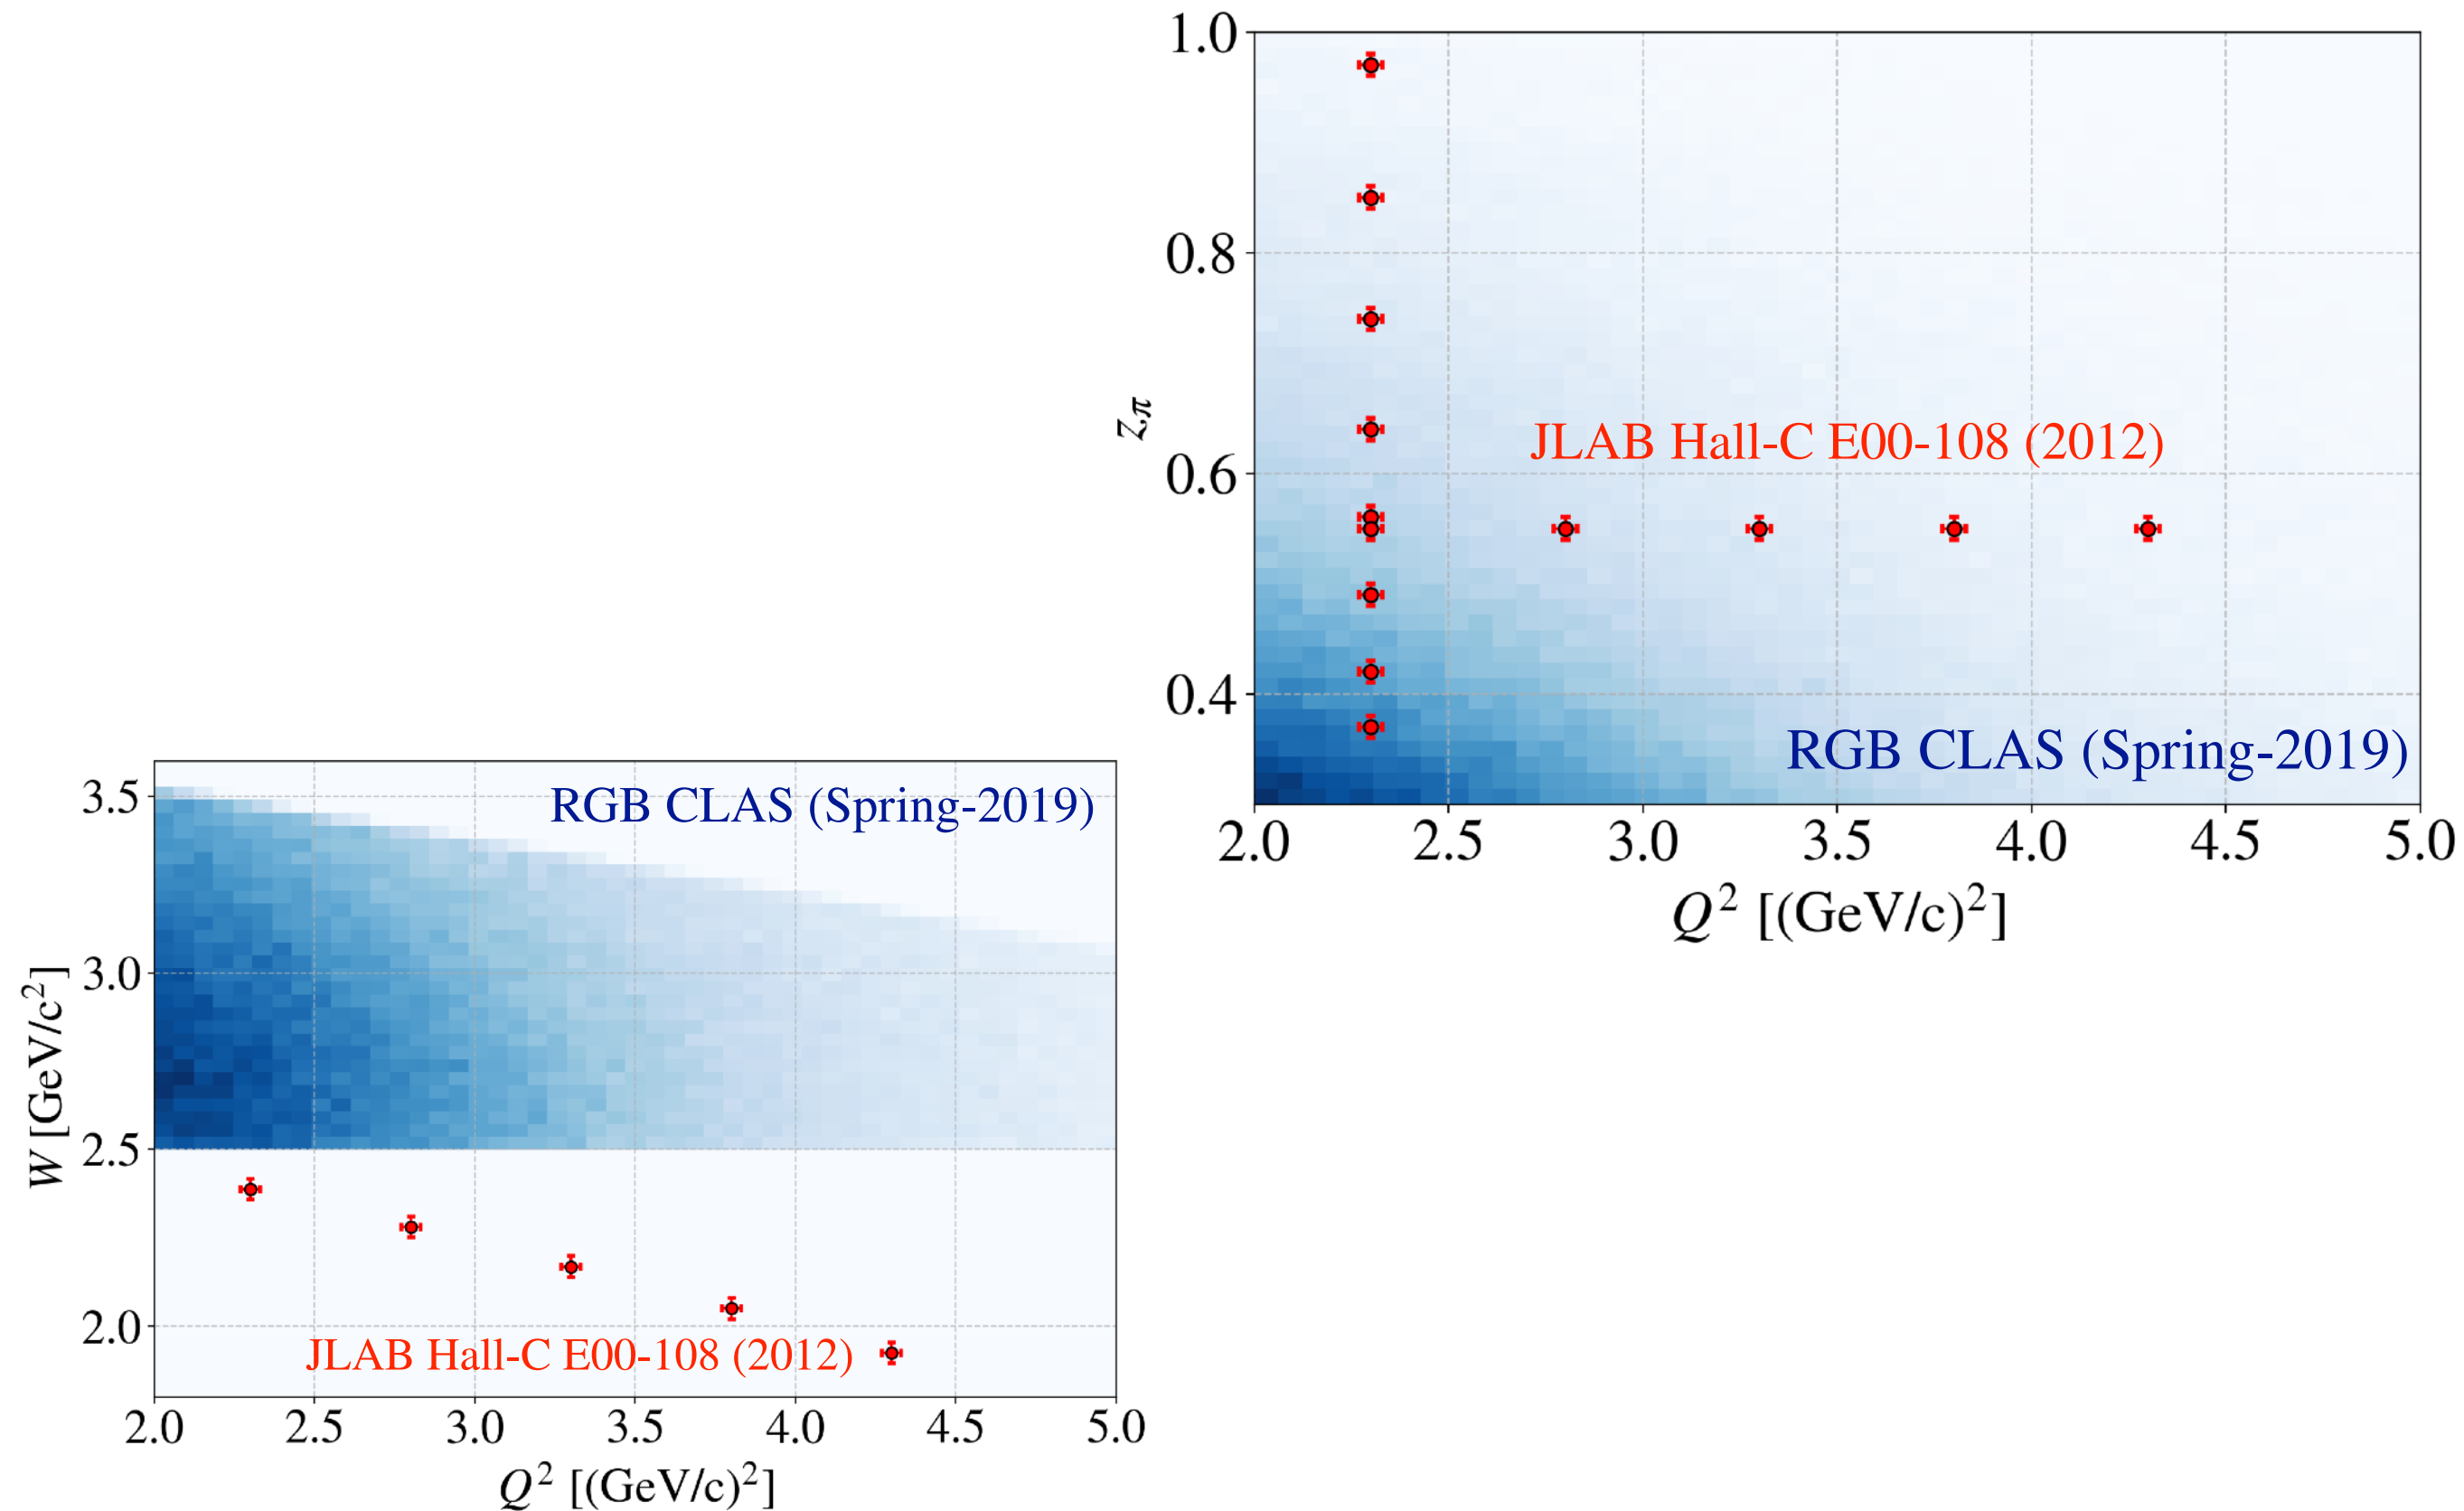

Untagged data

17.1 M  $\longrightarrow$   $\frac{\sigma_{d(e,e'\pi^+)}}{\sigma_{d(e,e'\pi^-)}}$

10.2 M  $\longrightarrow$   $\sigma_{d(e,e'\pi^-)}$

# Kinematical coverage

# $M_x$ in bins of $Q^2$ for $d(e, e'\pi^+)$

# $M_x$ in bins of $Q^2$ for $d(e, e'\pi^-)$

# Parton model expectation

- The Mott cross section for the scattering off a

quark  $\xi$  is  $\sigma_{(e,e'\xi)} \propto q_\xi^2 f_\xi$

# Parton model expectation

- The Mott cross section for the scattering off a

quark  $\xi$  is  $\sigma_{(e,e'\xi)} \propto q_\xi^2 f_\xi$

$f_\xi$  is the nuclear PDF  $\xi = u, d, s, \dots$

# Parton model expectation

- The Mott cross section for the scattering off a

quark  $\xi$  is  $\sigma_{(e,e'\xi)} \propto q_\xi^2 f_\xi$

- $\pi^+$  production off a  $p$ :

$$\sigma_p^{\pi^+} \propto 4u_\nu + rd_\nu + (\textit{sea contributions})$$

# Parton model expectation

- The Mott cross section for the scattering off a

quark  $\xi$  is  $\sigma_{(e,e'\xi)} \propto q_\xi^2 f_\xi$

- $\pi^+$  production off a  $p$ :

$$\sigma_p^{\pi^+} \propto 4u_v + rd_v + (\textit{sea contributions})$$

$r$  is the ratio unfavored/favored  
fragmentation probability

$D^+ \equiv D_p^{\pi^+} = D_n^{\pi^-}$  Favored fragmentation

$r(x, z, p_\perp) = D^-/D^+$

$D^- \equiv D_p^{\pi^-} = D_n^{\pi^+}$  Unfavored fragmentation

# Parton model expectation

- Assuming isospin symmetry, i.e.  $u_n = d_p, d_n = u_p$

and neglecting sea contributions,

$$\sigma_d^{\pi^+} = \sigma_p^{\pi^+} + \sigma_n^{\pi^+} \sim (4 + r)(u_v + d_v)$$

$$\sigma_d^{\pi^-} = \sigma_p^{\pi^-} + \sigma_n^{\pi^-} \sim (4r + 1)(d_v + u_v)$$

- $\pi^+/\pi^-$  cross-section ratio  $\rightarrow$  fragmentation ratio

$$r = \frac{4 - \left( \sigma_d^{\pi^+} / \sigma_d^{\pi^-} \right)}{4 \left( \sigma_d^{\pi^+} / \sigma_d^{\pi^-} \right) - 1}$$

# Parton model expectation

- Assuming isospin symmetry, i.e.  $u_n = d_p, d_n = u_p$

**We extract  $r$  from**

$$\sigma_d^{\pi^+} = \sigma_p^{\pi^+} + \sigma_n^{\pi^+} \sim (4 + r)(u_v + d_v)$$

$$\sigma_d^{\pi^-} = \sigma_p^{\pi^-} + \sigma_n^{\pi^-} \sim (4 + r)(d_v + u_v)$$

**the data**

- cross-section ratio  $\rightarrow$  fragmentation ratio

$$r = \frac{4 - \left( \sigma_d^{\pi^+} / \sigma_d^{\pi^-} \right)}{4 \left( \sigma_d^{\pi^+} / \sigma_d^{\pi^-} \right) - 1}$$

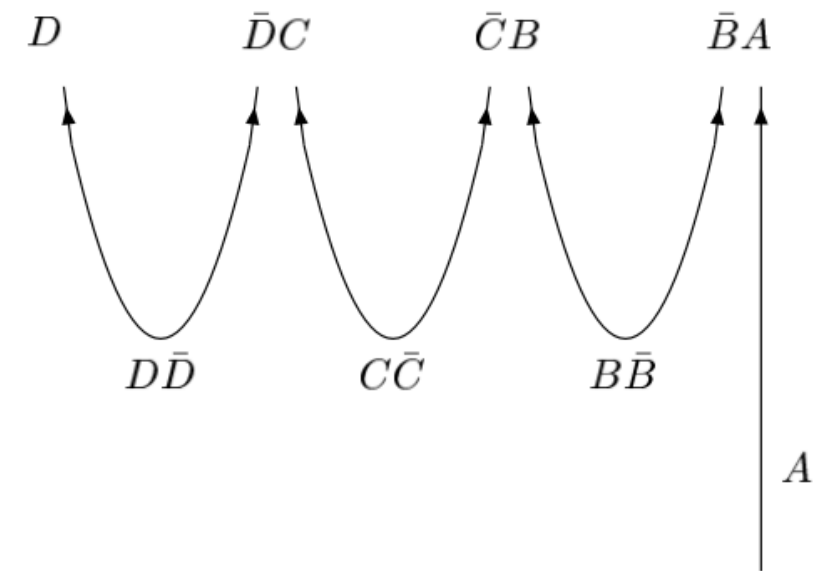

# Field & Feynman expectation

- Quark  $A$  emerges with momentum fraction  $z$  and creates a color field in which new quark-antiquark pairs are produced
- Quark  $A$  combines with an antiquark  $\bar{B}$ ....
- Quark jets analyzed recursively
- Result:

$$r = (1 - z)/(1 - z + z/\beta_u) \text{ with}$$

$$\beta_u = 0.46$$

We assume that quark jets can be analyzed on the basis of a recursive principle. The ansatz is based on the idea that a quark of type "a" coming out at some momentum  $W_0$  in the  $z$  direction creates a color field in which new quark-antiquark pairs are produced. Quark "a" then combines with an antiquark, say "b", from the new pair  $\bar{b}b$  to form a meson "a $\bar{b}$ " leaving the remaining quark "b" to combine with further antiquarks. The "meson" a $\bar{b}$  may be directly observed as a pseudoscalar meson, or it may be a vector or higher-spin unstable resonance which subsequently decays into the observed mesons. To avoid complicating the ideas, we will call "a $\bar{b}$ " the "primary" meson state and shall discuss secondary decay processes later. A "hierarchy" of primary mesons is formed of which a $\bar{b}$  is first in "rank", b $\bar{c}$  is second in rank, c $\bar{d}$  is third in rank, etc., as shown in fig. 1. (The "rank" in "hierarchy" should *not* be confused with order in momentum, but only order in the flavor relationships. The rank-2 primary meson may sometimes obtain a larger momentum than the rank-1 primary meson.)

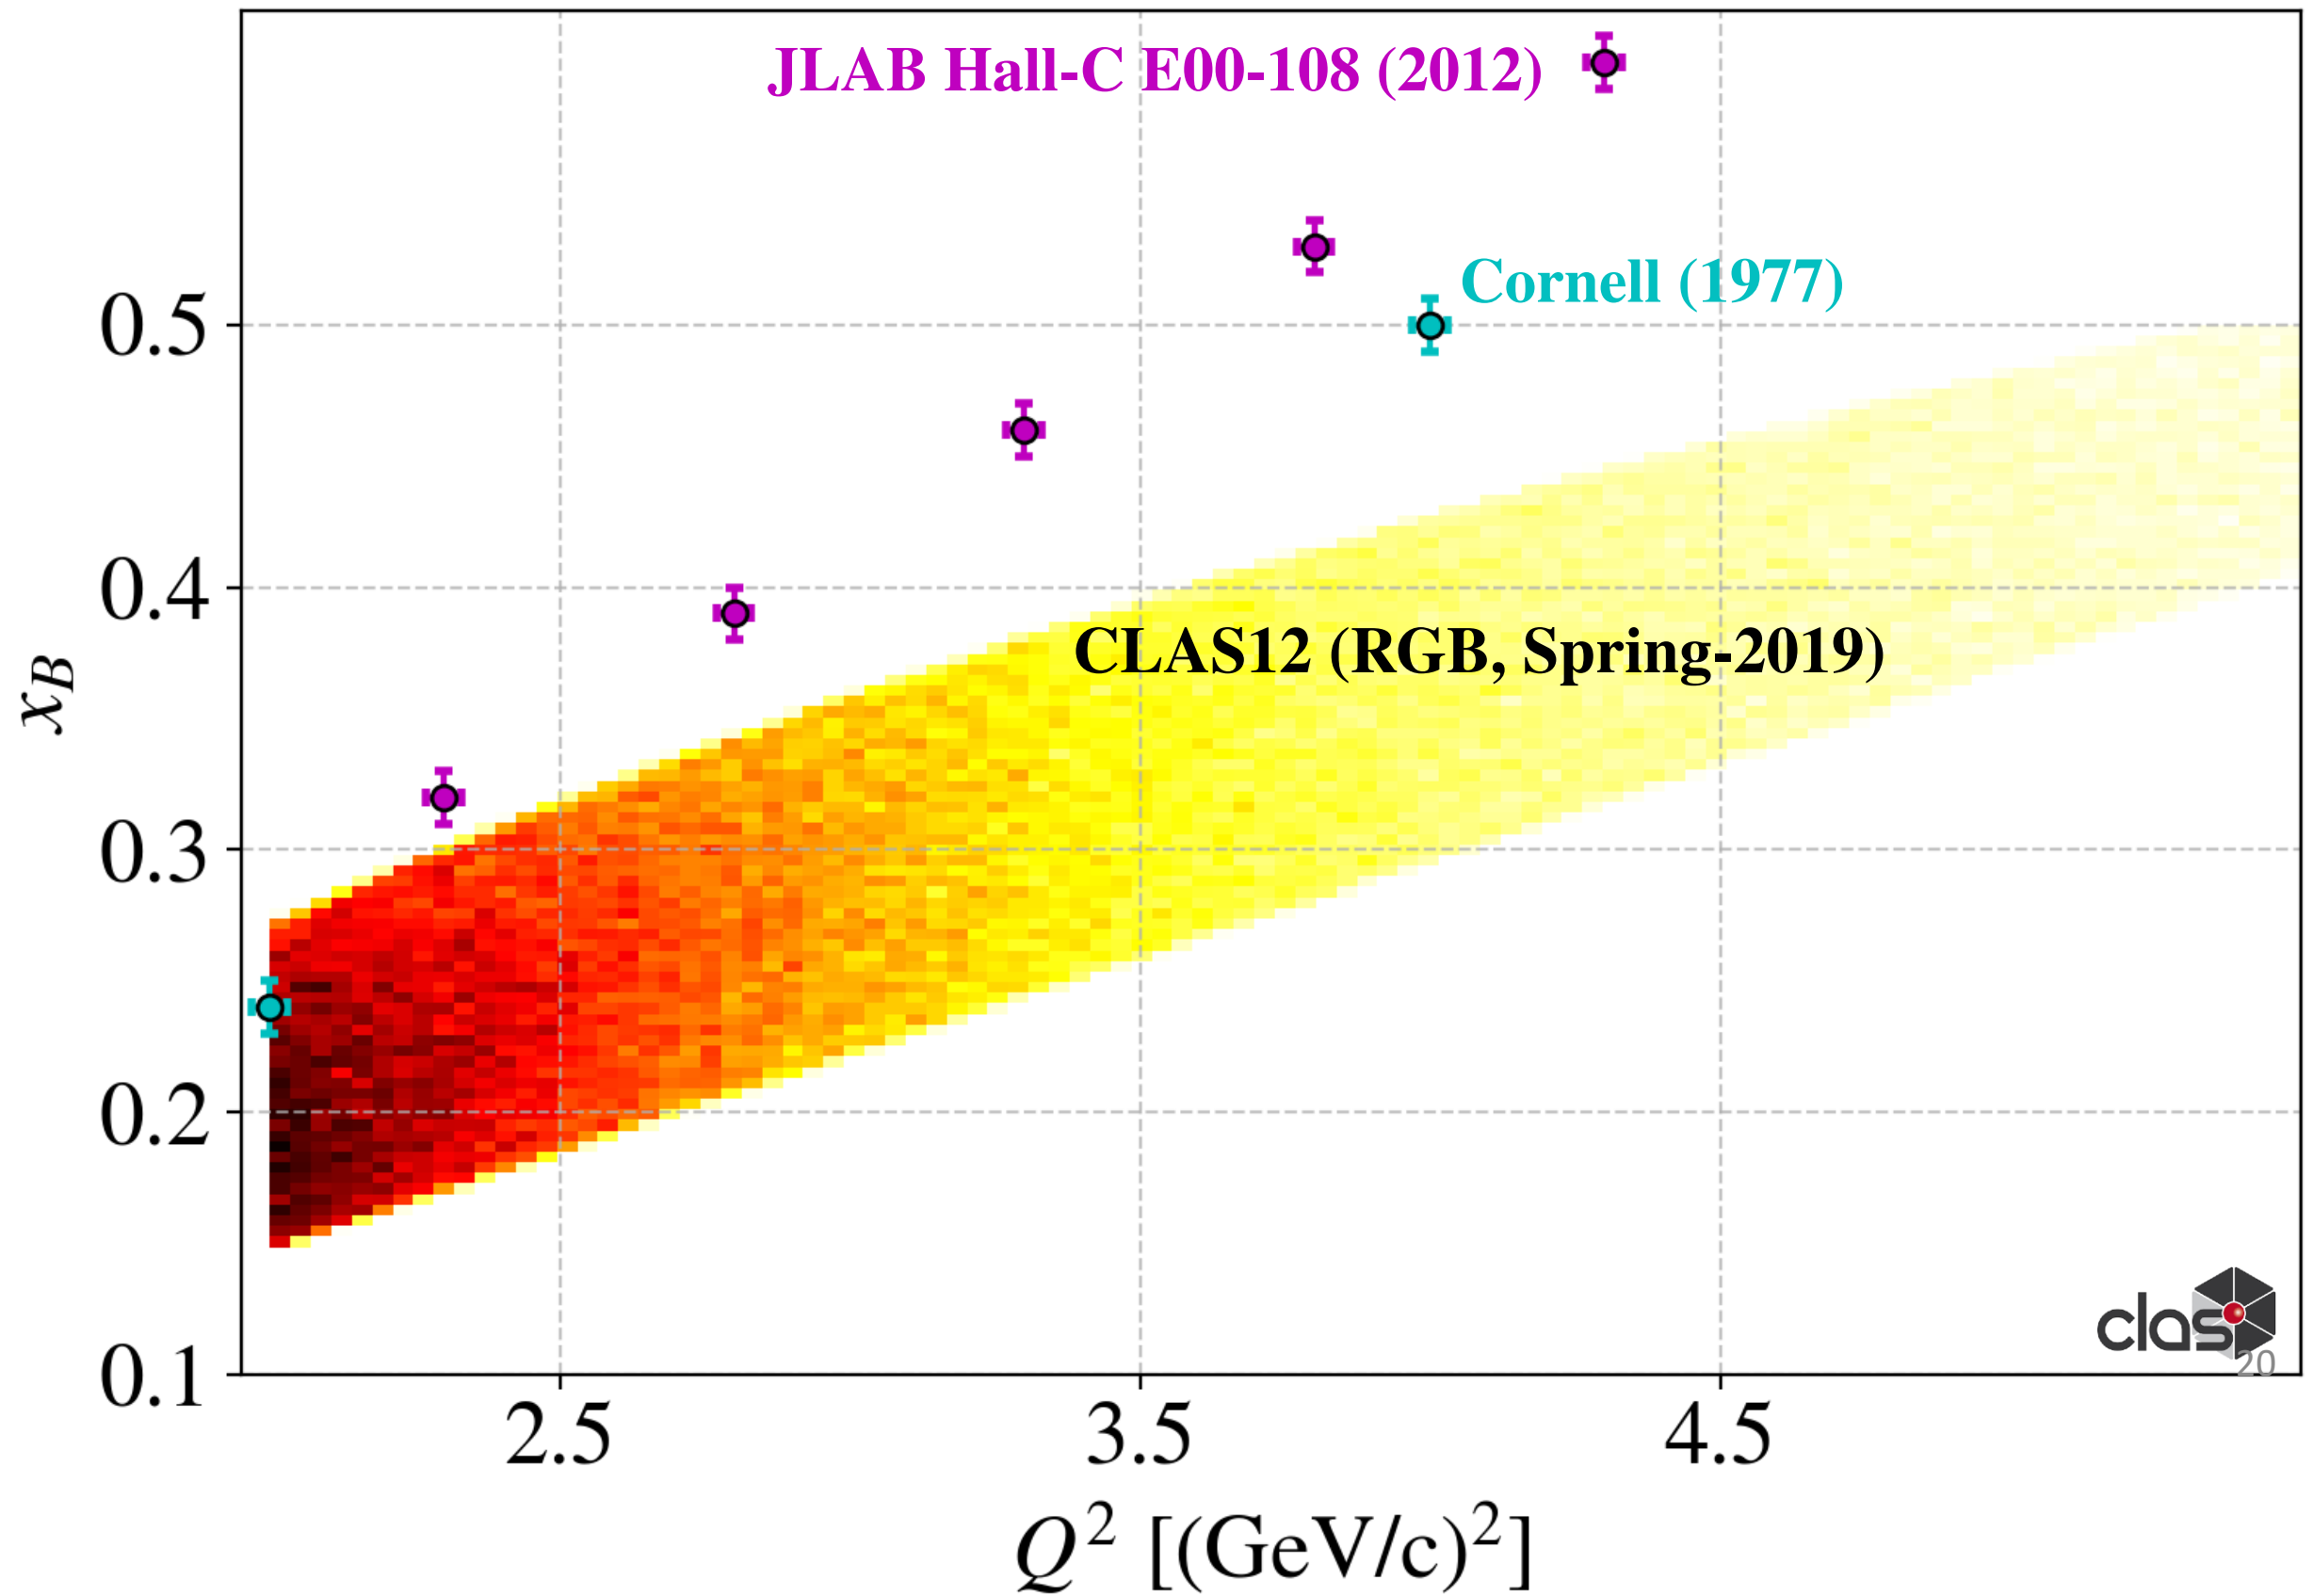

$$D_d^{\pi^+}(z)/D_u^{\pi^+}(z) = \frac{\beta_u(1/z - 1)}{(1 - \beta_u + \beta_u/z)}$$

**corrections to  $p_T$**

**and more**

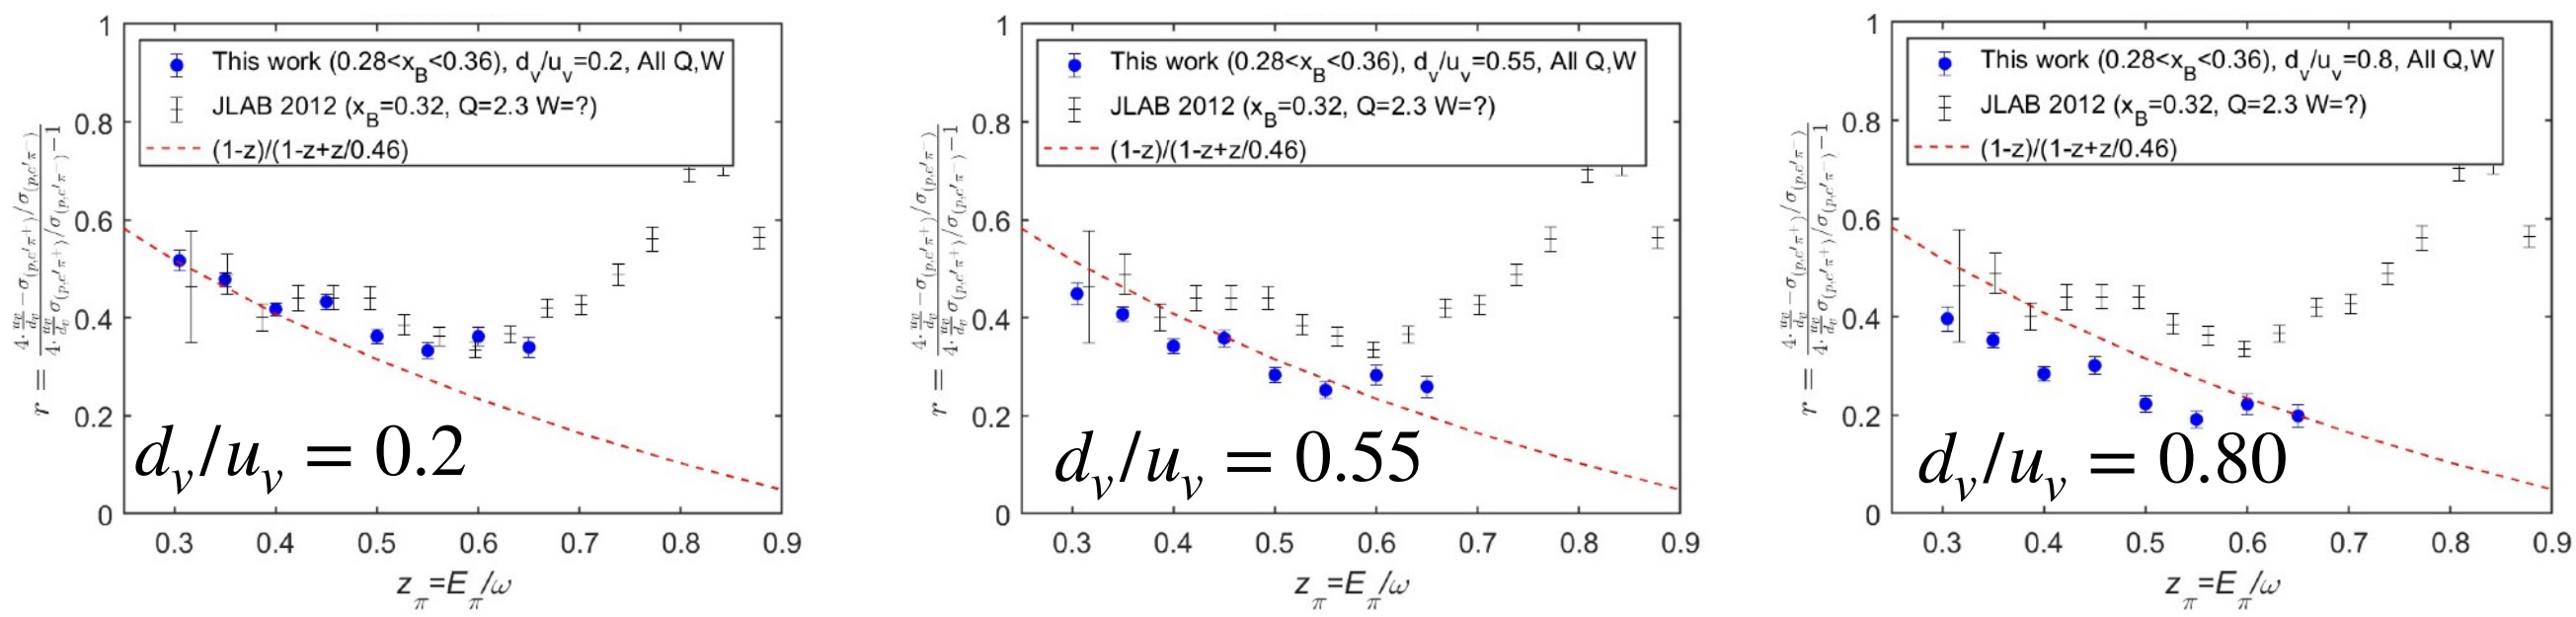

Extract  $d_\nu/u_\nu$  from  
free- $p$  data

- For SIDIS off a free proton

$$r = \frac{4\frac{u_v}{d_v} - \left(\sigma_p^{\pi^+} / \sigma_p^{\pi^-}\right)}{4\frac{u_v}{d_v} \left(\sigma_p^{\pi^+} / \sigma_p^{\pi^-}\right) - 1}$$

- We extract  $\sigma_p^{\pi^+} / \sigma_p^{\pi^-}$  from RGA data
- By comparing to FF model we extract  $u_v / d_v$  from the proton data only

# SIDIS@RGB | Extraction of $d_v/u_v$ from free- $p$ data

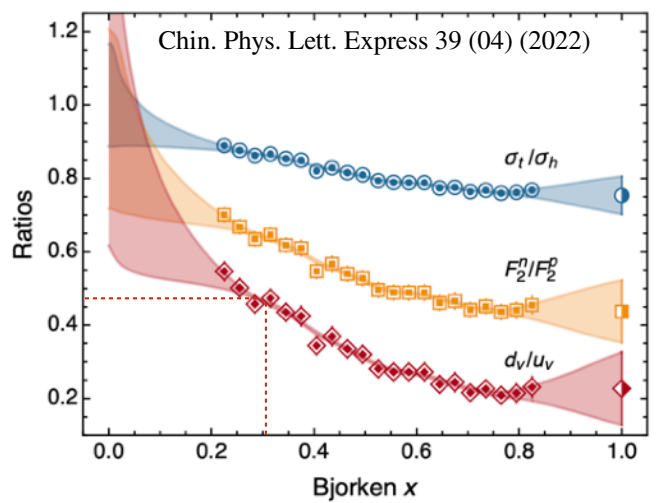

Free Proton,  $0.28 < x_B < 0.36$

Our results:  
 $d_v/u_v = 0.45 \pm 0.1$

Preliminary

# SIDIS@RGB | Extraction of $d_v/u_v$ from free- $p$ data

# SRC-tagged data

- For SIDIS off the proton in the deuteron

$$r = \frac{4 \frac{u_v}{d_v} - \left( \sigma_d^{\pi^+} / \sigma_d^{\pi^-} \right)}{4 \frac{u_v}{d_v} \left( \sigma_d^{\pi^+} / \sigma_d^{\pi^-} \right) - 1}$$

- $u_v/d_v = 1$  for inclusive scattering off a deuteron

Our tagged data show clearly a scattering of a  $p$ , but not enough to tell the difference between free/bound

- We study  $(e, e' \pi^\pm)$  ratio untagged / tagged (with recoil  $n$ )  
CLAS12 + BAND
- 1<sup>st</sup> step: Untagged  $\pi^+ / \pi^-$  ratio
  - Consistent with published data at low  $Q^2$
  - Approach Parton model at high  $Q^2$
  - Extract  $u_v / d_v$  for free- $p$  based on Parton model
  - Fragmentation at large  $p_T$
- Next: SRC-tagged data, looking for difference between bound and free  $p$
